Description

The HD61203U is a common signal driver for dot matrix liquid crystal graphic display systems. It generates the timing signals (switch signal to convert LCD waveform to AC, frame synchronous signal) and supplies them to the column driver to control display. It provides 64 driver output lines and the impedance is low enough to drive a large screen.

As the HD61203U is produced by a CMOS process, it is fit for use in portable battery-driven equipment utilizing the liquid crystal display's low power consumption. The user can easily construct a dot matrix liquid crystal graphic display system by combining the HD61203U and the column (segment) driver HD61202U.

Oscillator

The CR oscillator generates display timing signals and operating clocks for the HD61202U. It is required when the HD61203U is used with the HD61202U. An oscillation resister R_f and an oscillation capacitor C_f are attached as shown in Figure 1. When using an external clock, input the clock into terminal CR and don't connect any lines to terminals R and C.

The oscillator is not required when the HD61203U is used with the HD61830. Then, connect terminal CR to the high level and don't connect any lines to terminals R and C (Figure 2).

Figure 1 Oscillator Connection with HD61202U

Figure 2 Oscillator Connection with HD61830

Timing Generator Circuit

The timing generator circuit generates display timing and operating clock for the HD61202U. This circuit is required when the HD61203U is used with the HD61202U. Connect terminal M/S to high level (master mode). It is not necessary when the display timing signal is supplied from other circuits, for example, from HD61830. In this case connect the terminals FS, DS1, and DS2 to high level and M/S to low level (slave mode).

Bidirectional Shift Register

A 64-bit bidirectional shift register. The data is shifted from DL to DR when SHL is at high level and from DR to DL when SHL is at low level. In this case, CL2 is used as shift clock. The lowest order bit of the bidirectional shift register, which is on the DL side, corresponds to X1 and the highest order bit on the DR side corresponds to X64.

Liquid Crystal Display Driver Circuit

The combination of the data from the shift register with the M signal allows one of the four liquid crystal display driver levels V1, V2, V5 and V6 to be transferred to the output terminals (Table 1).

Table 1 Output Levels

Data from the Shift Register	M	Output Level

M/S	1	I	V _{CC} or GND	Selects master/slave. - M/S = V_{CC}: Master mode When the HD61203U is used with the HD61202U, timing generation circuit operates to supply display timing signals and operation clock to the HD61202U. Each of I/O common terminals DL, DR, CL2, and M is in the output state. - M/S = GND: Slave mode The timing operation circuit stops operating. The HD61203U is used in this mode when combined with the HD61830. Even if combined with the HD61202U, this mode is used when display timing signals (M, data, CL2, etc.) are supplied by another HD61203U in the master mode. Terminals M and CL2 are in the input state. When SHL is V_{CC}, DL is in the input state and DR is in the output state. When SHL is GND, DL is in the output state and DR is in the input state.
FCS	1	I	V _{CC} or GND	Selects shift clock phase. - FCS = V_{CC} Shift register operates at the rising edge of CL2. Select this condition when HD61203U is used with HD61202U or when MA of the HD61830 connects to CL2 in combination with the HD61830. - FCS = GND Shift register operates at the fall of CL2. Select this condition when CL1 of HD61830 connects to CL2 in combination with the HD61830.

9. This value is specified for current flowing through GND in the following conditions: Internal oscillation circuit is used. Each terminal of DS1, DS2, FS, SHL, M/S, $\overline{STB}$, and FCS is connected to V_{CC} and each of CL1 and TH to GND. Oscillator is set as/ described in note 7.
10. This value is specified for current flowing through GND under the following conditions: Each terminals of DS1, DS2, FS, SHL, $\overline{STB}$, FCS and CR is connected to V_{CC} , CL1, TH, and M/S to GND and the terminals CL2, M, and DL are respectively connected to terminals CL2, M, and DL of the HD61203U under the condition described in note 9.
11. This value is specified for current flowing through V_{EE} under the condition described in note 9. Don't connect any lines to terminal V.

$$V_{CC}-V_{EE} = 10V$$

$$V1L = V1R, V6L = V6R = V_{CC} - 1/7 (V_{CC}-V_{EE})$$

$$V2L = V2R, V5L = V5R = V_{EE} + 1/7 (V_{CC}-V_{EE})$$

The following is a description of the range of power supply voltage for liquid crystal display drive. Apply positive voltage to V1L = V1R and V6L = V6R and negative voltage to V2L = V2R and V5L = V5R within the ΔV range. This range allows stable impedance on driver output (R_{ON}). Notice that ΔV depends on power supply voltage $V_{CC}-V_{EE}$.
