# INTRODUCTION

The book you hold in your hands is the first of a proposed series for the computer hobbyist. It contains exciting programs excerpted from *SoftSide* magazine. The programs are presented in a ready-to-type format, chosen to appeal to a wide range of programmers—from the beginner to the advanced computerist.

Herein lies a tantalizing, illustrated sample of short, simple programs and longer, more complex games and adventures from *SoftSide*.

*SoftSide* magazine is unique in both the publishing and computer business. From its humble beginnings in October 1978, when it consisted of two workers operating out of the basement of the publisher's home, it has grown to a magazine with over 15,000 subscribers and a staff of more than a dozen people. The original *SoftSide* was a digest-sized publication dedicated to TRS-80® programming. Now it is a full-sized, glossy-papered magazine that publishes programs and advice for owners of TRS-80s®, Apples, and Ataris, with occasional programs included for other micro-computer systems.

Now in its third year of publication, *SoftSide* is meeting the ever-growing demand for new software and programming information for the increasing market of microcomputer owners. Each issue offers a variety of stimulating game programs for the various microcomputers, plus a healthy dose of utility, educational, and business programs to meet the needs of all its readers. The serious programmer will find articles explaining the workings of his computer and how to make it do new and different tasks.

*SoftSide*'s subscribers come from all parts of the world, from Saudi Arabia to Switzerland. Some buy the magazine and type in the programs themselves, while others take advantage of the opportunity to receive the magazine not only in printed form but accompanied by either a disk or a cassette containing all the programs pertaining to their computer, ready to run.

This book should give you an idea of what *SoftSide* includes. It does not contain the advice and support for the learning programmer—beginner or advanced—that the magazine prints as a matter of course in each issue. If the programs that lie between the covers pique your interest, then the magazine itself should be an affair of fascination. But see for yourself. We feel the programs will do the talking.

# AROUND THE HORN

*By Rev. George Blank*

The discovery of gold at Sutter's Mill in 1849 triggered a hurried migration to California that lasted for several years. While few prospectors struck it rich, many shippers did by shipping men and supplies to California. For instance, records show that flour sold for as high as \$44.00 a barrel. The highest freight and passenger rates went to the fastest ships, and three of the fastest were the *Surprise*, the *Flying Cloud*, and the *Challenge*.

The *Surprise* was owned by A.A. Low and Brother, and her captain was Phillip Dumaresq. This clipper, displacing 1,261 tons, sailed in December 1849 on a record-breaking run to San Francisco of 96 days, 15 hours.

The high demand for fast shipping, not only in the California trade but in the transatlantic trade to Liverpool and the China tea and spice trade as well, led to the golden age of the clipper ship. Two of the greatest were launched within weeks of each other in 1851 and raced to California amidst great publicity. They were the *Flying Cloud* and the *Challenge*.

The *Flying Cloud*, owned by Grinnel, Minturn and Company, was captained by Josiah Cressy. This ship of 1,782 tons left on June 2, 1851, and set a new record for the California trade of 89 days and 21 hours. This record stood for several years, partly due to stormy weather that moved the ship to record-breaking speeds of over 300 miles a day, several times. (The ship did suffer damage to her masts and rigging on the run.)

The *Challenge* sailed a few weeks later and ran into very calm weather, leading to a disappointing but still impressive time of 108 days. Captained by Bob "Bully" Waterman, the *Challenge* was the largest ship of her day at 206 tons and was owned by N.L. & G. Griswold.

This computer program tampers with history a little to allow the three ships to sail from New York on the same day in a race to San Francisco. [You will captain one of the ships and attempt to find favorable winds and currents that will allow you to get to San Francisco first. It is by no means certain you will arrive in San Francisco.] The passage around Cape Horn is dangerous, and many vessels were wrecked there. If you try to sail through the doldrums at an angle and have bad luck, you could spend months right there.

The computer will display a map of North and South America, with New England indicated by the letter *N* and San Francisco by the letter *S*. Your position will be indicated by an exclamation mark and that of the other vessels by the first letter of their names, assuming that they are not in the same square. To win, all you have to do is sail your ship into the square containing the *S* in the fewest days. As soon as you enter any point in that square, the computer will print an arrival notice.

You will begin each turn by indicating the course you wish to sail. While the computer asks for a number, it also will respond to *N*, *E*, *S*, and *W* for north, east, south, and west.

Once you have entered a course, the computer will display your ship, the ocean, any land in sight from the bow, and your topmast staysail. The size and position of your sail will indicate the tack you are on. The wind comes across the side of your ship opposite the sail. The three sizes of sail indicate that you are close hauled (sailing into the wind), on a reach (wind coming from the side), or running (wind at your back). The larger the sail, the faster you are going.

Ships cannot sail directly into the wind and yours is no exception. In fact, it will not sail closer than 45 degrees to the direction from which the wind is coming. The computer will automatically change your course if the wind shifts against you, and change it back when the wind changes back. Should you wish to make a course correction, you may press *Z* for a 22.5-degree turn to starboard (right for you landlubbers) or press */* for a turn to port. You will find it especially helpful to keep one finger on the *Z* and one on the */* when you are making the passage around Cape Horn.

In the center of the screen, directly above the waves, the computer will display any land that is in sight. Don't count on seeing land before you run aground! Sometimes you will see it in time and sometimes not. It is safer (but sometimes slower) to stay away from the coast completely.

There are some navigational aids provided by the computer. You have a compass in the center of the ship and a nameplate under it. When the computer accepts a course change, it will display "PORT" or "STAR'D" where the nameplate is. At the bottom left is information on the direction the wind is coming from and the wind speed. The bottom right displays the ship's calendar and your last navigational position. Expert players will want to depend on this latitude and longitude display extensively, for the map and land displays give only a rough indication. As a help to players, I have included a table of ocean currents, a table of climatic regions, and some notices to mariners, all of which relate to the latitude and longitude.

Landlubbers may assume that a ship will sail in the direction she is pointed, but "it ain't necessarily so." Two other factors affect your course: leeway and current. Leeway is the result of the wind blowing you off course in the direction it is blowing. Current carries you in the direction the water is flowing; most globes and atlases list ocean currents to give you an idea of the direction. The globe may be easier to understand than the table provided, as the simulation is reasonably accurate.

Weather also is a factor, but there is a trick to it: the computer only checks the region at the beginning of each turn. So you can wait just north or south of the doldrums for a good wind and possibly get completely across without getting stuck. If you think this is cheating, enter this line in your program:

```
1110 GOSUB 7000:GOSUB 7600
```

The region will then be checked on each half day, but the game may take longer.

Just in case some sharpies tries to compare my latitude and longitude with the atlas, remember that they don't make very accurate atlases these days! Besides, haven't you ever heard of the continental drift theory? Bon voyage!

### Notices to Mariners

1. Observe special caution in Long Island Sound, Eastern U.S. Coast at 40 degrees north latitude. Onshore current is treacherous, especially when combined with southerly winds.
2. The Cape Horn Passage is extremely dangerous. For safe passage, remain south of 55 degrees, 30 minutes, until longitude 72 degrees west and south of 46 degrees latitude until longitude 84 degrees west. Dangerous polar ice is virtually certain south of 64 degrees south latitude.
3. The Caribbean Sea contains many unmarked reefs and is especially hazardous without local knowledge.
4. Vessels are advised to maintain good distance from the Northeast Coast of South America. Light winds and flat calms, combined with unfavorable currents, make long delays likely.
5. Vessels bound for California are advised to set course well west of the Southern Coast of Mexico. Light winds make delays likely.
6. Beware of all capes. Reefs often project out from them and make sudden shipwreck likely. (Computer only checks for land due north, east, south, and west. If you approach a cape from the northeast, for example, you will run aground before any land is displayed.)

*Ocean Currents*

Name	North	South	West	East
Japan Current	48N	-32N	132W	—
Japan Current	32N	-19.2N	129W	-114W
Gulf Stream	48N	-32N	—	39W
Gulf Stream	32N	-19.2N	—	63W
Canaries Current	48N	-28N	39W	—
N. Equatorial Current	19.2N	- 8N	—	—
Guinea Current	8N	- 0	24W	—
S. Equatorial Current	0	- 9.2S	—	—
Humbolt Current	9.2S	-27.6S	102W	—
Brazil Current	9.2S	-27.6S	—	48W
Benguela Current	9.2S	-27.6S	9W	—
West Wind Drift	44.2S	-64.4S	—	—

### *Climatic Regions*

<i>Name</i>	<i>Direction</i>	<i>Typical Winds</i>
Horse Latitudes	32N	Strong and variable
Northeast Trades	8N	Moderate from northeast
Doldrums	3S	Calm and variable
Southeast Trades	28S	Moderate from southeast
Roaring Forties	64S	Strong and westerly

# BARRIER

*By Eric Gordon*

You hear the clap of the starting pistol. As you move out into the center of the track in your super race car, you see your opponent racing toward you. It's now a test of nerve: who will break away first?

Just as you see the whites of his eyes, he breaks away from the collision course but, to your dismay, he leaves a trail of nails behind. You try to steer wide of the deadly spikes, but it's too late. Your tires collapse and at 110 miles per hour your car quickly disintegrates, not to mention you.

Here's BARRIER . . .

5            \*\*\* B A R R I E R \*\*\*

# BATTLE ROYAL

*By Robert F. Nicholas*

BATTLE ROYAL is a nine-man wrestling match puzzle complete with animation and sound!

Nine grapplers start out in the middle of the ring. They stomp their feet and wave their arms around in anticipation of the match. The battle continues until only one man is left standing in the middle of the ring.

Be sure to connect the auxiliary jack leading to your tape recorder to an amplifier/speaker so you will be able to enjoy the sound effects that have been included. Then begin solving the puzzle. See who can do it in the least number of moves.

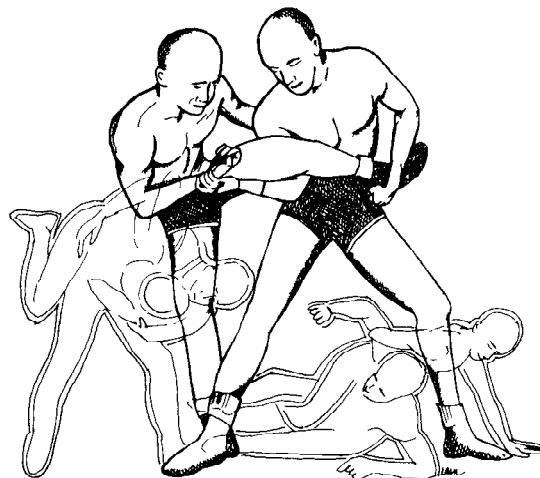

## Instructions

Enter RUN and read over the short set of instructions contained in the program. Then you'll be ready to enter the fracas.

The object is to remove eight of the wrestlers and leave the last one in the exact middle position in the ring (position #33). The computer will recognize that you have completed the puzzle once there is only one man left in 33. If you decide to quit sooner, enter QUIT as your move.

BATTLE ROYAL will prompt you all along and will point out any unacceptable moves to you. Appropriate error messages will be printed on the screen.

When you see the question "MOVING FROM?" and the block cursor appear on your monitor, enter in the two-digit position you wish to move a wrestler from (or enter QUIT if you give up). If you have a wrestler in that position, you will then be asked "MOVING TO?" followed by an-

other block cursor. Type in the position of the empty space you wish to move to.

You can save one space horizontally, vertically, or diagonally, or you may jump over one other wrestler at a time. If your move isn't legal, you will be requested to enter that move again.

But if it is a legal move, your wrestler will be placed in his new position. Should the move involve a jump over another man, the two of them will first engage in a rather noisy wrestling match, after which one of them will be moved to the new position and the other will leave the ring.

Once there is only one wrestler left and he has reached the center of the ring, the computer will give you your rating. One is low and ten is high. Of course, the idea is to finish the puzzle in the least number of moves.

So slip into your trunks and step into the ring. The BATTLE ROYAL is about to begin. May the best man or woman win!

```

# BATTLESHIP

*By John M. Delaney, Jr.*

This is a single-player game of war in which the computer is a formidable opponent. It can be enjoyed by those aged ten or above.

Each side places its fleet of six warships of varying sizes on a 10-by-10 grid. With each turn, you enter horizontal and vertical coordinates and fire upon the enemy grid. If you make a hit on one of the enemy's ships, you try to zero in for the kill and keep hitting until it sinks. At all times the screen shows hits and misses for you and the enemy but of course doesn't reveal the position of any enemy ship until one is sunk.

The first one to send all six ships in the enemy fleet to Davy Jones's locker wins the game. So anchors aweigh. . .

# BOMBER

*By Chris Freund*

Everyone has a favorite canyon filled with debris, which must be cleared by bombing the daylights out of it. You say you don't have one? Astonishing. We'll remedy that right away.

This game begins with your selection of a canyon. Then you can fly over it, dropping bombs to clear the obstacles. Only one bomb can be dropped at one time, and you must wait for it to finish its destruction before dropping another. If you don't drop a bomb on a run, it counts as a miss.

```

# CALCULATED RISK

*By Steven Wexler*

CALCULATED RISK is an exciting, fast-moving game of skill, strategy, and speculation for up to three players (optimally, including the computer). The subtle maneuvering, sudden turnabouts, and swift-paced action add to the addicting nature of this game. CALCULATED RISK is for those who delight in mastering the odds; for those who relish the competition between man and machine; and for those who enjoy living dangerously. It is a game for the bold at heart!

## The Rules

The rules are deceptively simple. The object of the game is to amass the most points after seven rounds of play. Points are scored by rolling a pair of dice as many times as a player chooses. The round total is equal to the sum of the rolls. However, if any roll matches the turn's first roll, the turn ends with a score of zero. At any time during his turn, the player has the option of terminating the turn. Upon completion of his turn, the player's round total is added to his cumulative total. Once points are added to the cumulative total, they cannot be forfeited.

Since it is a disadvantage to roll before the other player(s) in a round, the player with the highest total leads in a round, followed by the player with the next highest total.

If a player is dissatisfied with his initial roll in a round, he may elect to veto the roll. The roll will be replaced with a new roll. A player may elect the veto option only once per game.

## Game Strategy

There are three themes that dominate the game's strategy. The first concept is that some rolls are more common than others. For instance, a seven will occur six times more often than a two. Therefore, if a player gets a seven on the first roll, he should play more conservatively than if he gets a two. In more technical terms, the ratio of expected payoff to risk (round total) should be balanced against the probability of failure for an additional roll.

The second concept to recognize is that turn order is very important. A player who knows the results of all the preceding players can adjust his play accordingly.

The third concept is that a player's relative position in the cumulative totals should affect how conservatively he plays. For instance, if he is way behind he should throw caution to the wind.

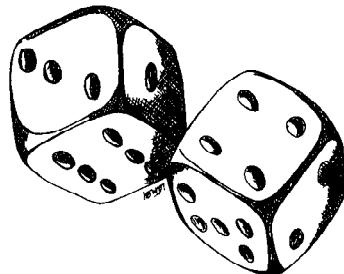

The first concept tends to dominate successful strategy early in the game, while concepts two and three become more important as the game progresses. The way these three factors are balanced separates the skilled player from the novice.

There are two philosophies on how to use the veto option. Some players prefer to veto the first seven that comes along. Other players like to save the veto option for critical late-round situations. Both philosophies have been used successfully.

### The Auto Move Option

After a roll is completed (including the veto option when applicable), the computer will ask, "(player's name), DO YOU WISH TO ROLL AGAIN (1=YES, 0=NO)? In addition to answering with 1 or 0, you may elect to type in a positive integer from 2 through 9. Doing this evokes the auto move option.

For example, if you type 5, the computer will give you five consecutive rolls. After five rolls (assuming no forfeit) you may terminate the turn, roll again, or select the auto move option again.

# CRAZY EIGHTS

*By Richard Murillo*

Here is a good card game to play on a rainy day when no one wants to play cards. The computer is your opponent and a worthy one he can be.

Playing against the computer, you will be trying to get rid of your seven cards before it dispenses with its own. You must match the suit or number of the card face up on the screen. If you can't, you must pick up another card until you can play. Eights are wild and can be used at any time, and you may choose any suit.

Here is one game where you really do want to end up with nothing. All points in you hand go to your opponent if it can get rid of its cards first. The highest number of points win the game.

```
1 '

# CYCLEJUMP

*By James S. Schaefer*

You may "carry your teeth home in your pocket" or "have broken every bone in your body" after trying this program on your computer.

CYCLEJUMP puts you on your bike jumping over from one to ten barrels at a time. You can set the angle of the jump and adjust your speed to insure a good jump. The wind speed and direction is set by the computer each time and should be taken into account when you make your jump. If you feel up to it, take the expert's level of 0; otherwise you have a total of ten levels of skill from 0 (hard) to 9 (easy).

Your bike's all throttled up and ready to go. The barrels are waiting...

# DIGITAL DOWNS

*By Al Ragsdale*

DIGITAL DOWNS is a simple simulation of a horse race including special graphics and sound effects. The rules for playing the game are included in the program. Up to ten players can play simultaneously, making it an interesting game for parties.

# DRAG RACE

*By Chris Freund*

This is a very short skill game for those who want to test their dexterity and coordination. The player must coordinate shifting and accelerating to get the highest speed possible. The game starts out with the "car" in first gear. The player uses the space bar as an accelerator, and he shifts by using the numbered key of the gear he wants to shift into. The most important thing to remember is that you must let up on the space bar in order to shift. Once the car has been shifted (you can tell it's been shifted when the tachometer goes down), the player must accelerate quickly in order to keep from losing speed. This is done through the four gears. Time will eventually run out, and the final speed will be stated. Of course, if the player doesn't shift and his tachometer goes too high, he'll blow an engine. Because an engine blows at random at high RPMs, top speed can be unpredictable, but anything over 130 is good, and anything over 135 is grand prix stuff.

Note the following:

1. The car starts out in first gear; there is no need to shift into it.
2. Downshifting is not allowed, and although a player can skip gears, this is not good strategy.
3. To find out when the engine will blow, just experiment. It is partially random.
4. Being too quick in shifting can hurt since the program may "miss" the shift. Experiment to find the best shifting speed.

# ENGINEER

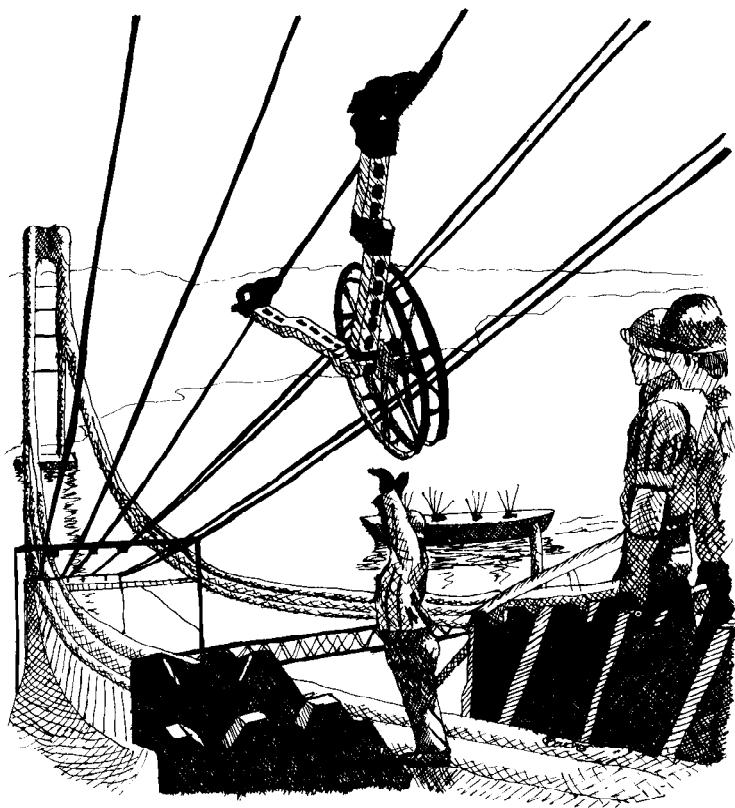

*By David Bohlke*

The object of this game is to construct a bridge connecting the two blocks at the top of the screen. To do this, you must place your beams in accordance with the inspector's specifications. You may work alone, or several players may compete to see who can construct the bridge in the fewest days.

You will discover a thing or two about construction (the right end of the beam must be supported) and inspectors (who mostly get in the way).

That bridge inspector is a pesky devil. The higher the bridge construction gets, the more he makes a nuisance of himself. No new beam can be placed above the level of his feet, and he tends to dislike heights. If you let him get you in a corner where you can't place a new beam, you have to give up and forget the game.

A relatively short, easy game but still very stimulating, it is unique, and we know of nothing else that is even similar.

```

# ENTRAPMENT

*By Robert C. Hall III*

This game looks deceptively simple. Actually, it's one of the best two-player games developed for the Z-80. It requires fast reflexes, quick thinking, and grand strategy. Skill determines the outcome, yet the range is so broad that a four-year-old can play and enjoy it, so long as he's matched with an opponent of similar skill.

The object is to use the appropriate keys to move your line so that it boxes in your opponent. If you run into your opponent, the boundaries, or even your own line, you lose. This can be as simple as inadvertently pushing the down button when you're going up.

For younger children, the keys can be marked with arrows using tape or stick-on labels. You may find it necessary to require a person to move before his opponent gets halfway across the screen, otherwise a player could just sit still until the other player makes a mistake.

# GOBLINS

*By Gary S. Breschini*

This program is designed to lead a reasonably good warrior (you) on a heroic quest to save the prince/princess. There are magic rings, swords, and wizards to aid you on your journey, but the woods also are full of bad guys and a few surprises. Your decisions influence the outcome of the game. You might be lucky enough to rescue the prince/princess, or you might be eaten by a dragon! Each time the game is played it will be different because there are so many routines and subroutines that it is possible to play for hours and even days without seeing all of the program.

## The Program

To enter the magic forest, you must first enter GOBLINS into your TRS-80®. This takes just over 4 minutes at normal speed, so be patient. As soon as the program has loaded RUN and ENTER, directions will appear on the screen. Remember, you need at least 15 victories, 75 luck points, and the enchanted sword in order to be eligible to save the prince/princess. It helps to avoid curses, which reduce your luck, and to try to get a magic ring, which adds to your luck. Don't run out of food, since you may starve to death. Good luck, you are about to enter the magic forest . . .

When you enter the forest, the first thing you will encounter is the scoreboard. This tells you how well you are doing and tests whether you have proven yourself a good enough warrior to attempt to rescue the prince/princess.

LUCK	10	CURSES	0	GOLD	15	SWORD	NO
FOOD	35	VICTORIES	0	RING	NO		

Immediately under the scoreboard you will encounter your first decision point. Which way will you go, EAST or WEST? Make your decision and press the appropriate key. The computer will take over—there is no need to press ENTER after the number since the program makes extensive use of the INKEY\$ function. Press the number of your choice and see where you end up.

As you progress on your journey through the forest you will encounter a number of obstacles—a river, lake, mountain, etc.—which will force you to make a decision. Each time you make a decision, it influences the outcome of the game. It pays to learn by your mistakes. Remember where different decisions lead you, and select the ones with the best odds. Certain choices at certain points will lead (on the average) to more favorable areas, while other choices will lead to areas that are downright nasty. Here are some hints:

1. Try to avoid fights unless you have the sword.
2. If you do have the sword, look for fights.
3. Remember where you have been.

Most of the decision points require that you input a number, but there are a few places where you must input a Y for yes or an N for no, so read the question carefully. Occasionally it may appear that the computer skipped over a decision point and went on without you. If this happens, the chances are that you hit the key more than once or the keys need debouncing. Unfortunately, there is not enough room in 16K for the KBFIX program and GOBLINS at the same time. Sometimes a routine will reappear several times in a row. This is due to random chance, and the odds are low that it will happen, so you should not see it often.

Eventually you will come to the end of your journey (unless you starve to death or end up as a dragon's lunch). Either way, the program will recycle to the beginning and give you another chance.

# ISOLATE

*By James Garon*

The object of this game is to isolate your opponent (the computer) so that there is nowhere for it to move on its turn; you do this by destroying squares until you box it in. At the same time, you have to keep moving about to sidestep being boxed in yourself.

When you have become proficient and cocky at level one, try going to levels two and three, where the computer destroys two or three squares at a time, while you get to destroy one!

The action is accompanied by lively sound effects to make winning all the more fun.

```

# JIGSAW

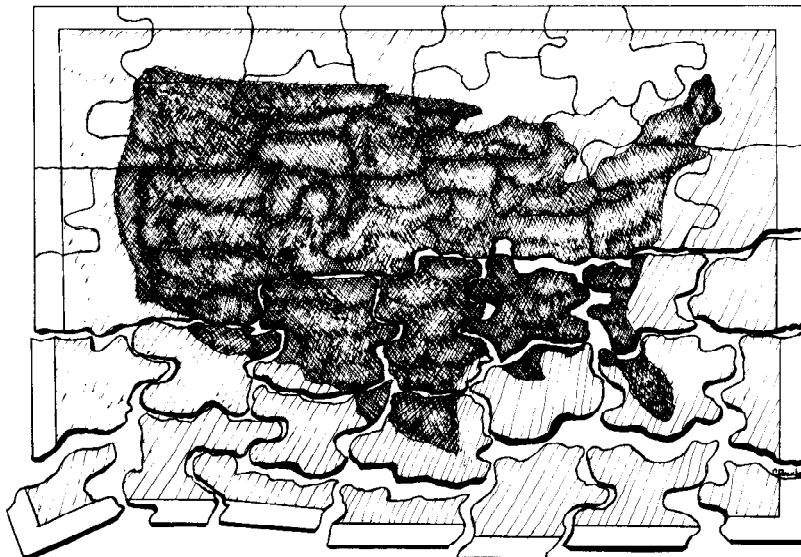

*By David Bohlke*

At last, here's a program for the person who's always going to pieces.

If getting yourself together seems to be something you never quite accomplish, now you can practice on a puzzle that has fewer pieces than the average person has problems. Exercise your problem-solving abilities, and get yourself ready for the big challenges such as what to do when the TRS-80® club meeting, a big football game, and your wife's class reunion all occur at the same time.

The pieces can be rotated to fit in upside down or sideways, and if you guess at any square that the piece will cover, your guess is correct. The computer will pick the puzzle—you must guess it. When playing in a group, each member can take certain pieces so that there is a guessing strategy for each piece. Or compete to assemble the puzzle in the fewest tries. Here's how you can score yourself:

- 5-7 Genius: President Reagan needs you to figure out inflation.
- 8-10 Expert: You could get away with dating four people at one time.
- 11-15 Good: Able to chew gum, walk, and think simultaneously.
- 16-20 Fair: Must chew, walk, or think, one thing at a time.
- Over 21 Try Again: After all, even Einstein didn't talk until he was 3.

```

# KALEIDOSCOPE

*By James Garon*

A constantly growing and shifting pattern fills the computer screen until you have a full-blown design reminiscent of your early days when you bought your first kaleidoscope at the corner 5 & 10. This short, efficient program brings you pleasure with its ever-changing patterns. When you tire of watching one, press **ENTER** to find another new and different pattern to watch and admire.

# KRONEN

*By Galen E. Hamilton*

This is a matching game complete with your own money to bet (kronen) and Darth Vader to be your adversary.

You are given ten kronen to start out the game. Each time three figures on your cards match, you win ten kronen. Each time two figures match, you win two kronen.

But watch out for Darth Vader. One Darth Vader on the cards will cost you two of your kronen. Two Darth Vaders will cost you five kronen. If three of them show up, you will lose the game. Each play costs you one kronen. Good luck and watch out for Darth Vader.

```

# LETTER CRUNCH

*By David Bohlke*

*SoftSide* is proud to present a demonstration of how "bugs" survive inside your TRS-80®. As we all know, life is only possible if we have something to eat. We guessed that the bugs in our computers ate the contents of memory, but we weren't sure of this until David Bohlke actually managed to interview a bug.

He learned that eating is a major form of pleasure for bugs, so much so that they've turned dining into a game of strategy. The game played by the bugs was described in enough detail that we're able to present a simulation with the same strategy. Now, the next time a program bug eats up your computer memory, you'll know how the process works!

The bugs base their game on simple rules that tell how much memory they can gobble in one bite and how delicious that memory is. They love the taste of pluses (+ + +) but hate asterisks (\*\*\*) . Spaces are tasteless and do not count. All other memory contents are nourishing and satisfying but have only one taste point per space occupied.

To play the game, you select a row and get to eat the letter directly to the right of the row number. In several cases, you also get to eat adjacent characters. If you select the letter *B*, you get to eat the memory cell directly below the one you select. These options are displayed graphically for you at the bottom of the screen when it's your turn. The letter *A* gives you only the cell that it is in, while letters *B-F* give you additional points if there are characters in those cells.

To win, you must not only select the option that gives you the best score but also avoid giving your opponent a good opportunity. That may be tougher than it looks!

# MAGICAL JOURNEY

*By Peter Kirsch*

You enter a world in which no mortal has ever set foot. It is filled with danger, puzzles, and many exotic treasures. Your magical trek has begun. You journey through three different lands, seeking the riches that lie in wait. There will be many roadblocks crossing your paths. Can you find the magical cave, guarded by a mean and hungry dragon, which will lead you safely back home? Watch out for the dreaded axman or killer frog. Or perhaps the giant chicken will mistake you for a kernel of corn.

This adventure has a total of 76 locations, 17 treasures, and seven monsters. There are many pitfalls and puzzles to solve.

Use two-word commands to communicate with the computer, such as GET AX, DROP AX, and OPEN DOOR. To move in a particular direction, type that direction or merely its first letter (N, E, S, W, U, D). To restore the display, if needed, type LOOK. To see a list of the items you're carrying, type INVENTORY or just I.

Now you're on your own.

```

# MATCH GAME

*By Ralph G. White*

A reciprocal agreement seems to have been made between writers of game and educational programs not to invade each other's domain. The following program is designed to violate that agreement; its purpose is to encourage the learning of the states and their respective capitals in an entertaining way.

The program places two players in a game environment. They command opposing armies from Venus and Mars, simultaneously attempting to conquer the Earth. The format is based on the television game "Concentration." Earth is divided into 24 regions (a 6-by-4 playing grid) that must be captured. The player who has the most regions after all the spaces have been captured wins the planet. To win regions, players must match a state with its capital. A player chooses two squares. If a state is shown on one square and its capital on the other, the player wins the two squares and is allowed two more choices. If any other combination appears, then play passes to the other person.

Although the computer always requests the name of the Martian commander first, there is no advantage to commanding the army from Mars. At the beginning of each game, the computer randomly chooses which player will play first.

The program is written for two participants. The computer does not play; it referees, keeps score, and prevents illegal moves and cheating.

To initialize the game, the computer randomly selects 12 pairs of states and capitals from the list of 50 at the end of the program. These 12 pairs of data are then randomly positioned in the 24 squares on the playing grid. Each game uses a new set of states and capitals hidden in a different pattern.

When the squares are captured, the space is filled with the appropriate figure of a Martian or Venusian soldier. To maintain a high degree of interest in the display, the figures displayed in the captured regions constantly move their heads and look around in all directions. The constant movement provides an impression of real-time activity.

Since the display is highly formatted, each entry is thoroughly tested to ensure that the playing grid is not destroyed or damaged by allowing the computer to attempt to process a bad entry. Each entry is tested to be sure of the following:

1. The entry was a number and not a letter or symbol entered by mistake.
2. The square chosen exists on the grid.
3. The square chosen has not been matched with another square already.

4. The second square chosen is not the same location as the first square chosen.

All entries are processed through the INKEY\$ function; this allows the computer to make the figures move around while waiting for players to make decisions. During the actual playing of the game, the **ENTER** key is not used.

The program need not be dedicated only to states and capitals. Any pair of facts may be implemented by changing the four strings in the data statements beginning in line 25001. The data statement in line 25000 informs the computer how many pairs of facts are listed. Line 10 dimensions the variables to accept 50 pairs of data. To increase the number of possible matching pairs, redimension X, Q, W\$, X\$, and Z\$, and possibly clear additional string space. Each square is allowed two strings of eight characters each. If a second string is not needed, enclose one blank space in quotations.

The variable at the beginning of each data statement that contains the matching pairs identifies each pair. This procedure was used instead of generating a value so that two or more pairs may be interchangeably matched if desired.

Other possible topics that could be used for the game include foreign language vocabulary, countries and capitals, units of measurement, dates and events, elementary math problems, and historical names.

You can enjoy the program as it is or easily modify it to meet your needs.

# MOVING MAZE

*By Paul Klinger*

Navigate the blinking dot through three sections of constantly moving maze, from the top to the bottom of the screen. Direction of the dot is controlled by the arrow keys. Any time you bump a wall—in any direction—the computer says “OOPS,” and you start over at the beginning of the section you are attempting. Time is of the essence. You are battling against a clock that ticks off your seconds of play in a corner of the screen. There are three levels of play: beginner, advanced, and super expert. But we haven’t found any super experts around here yet.

# NIM

By James Garon

On her honeymoon on the Italian Riviera in 1407, the Duchess of Santa Paravia invented a game of taking gold coins out of three plates. When her husband died the following year after a cold winter in a drafty castle, she returned to her native Britain, where she introduced the game NIM\* to the royal court, and it became the fad of the social season in 1409. The game didn't spread outside the royal court because the common people never even saw a gold coin, much less owned any. Therefore, when the court began to play Hunt the Wumpus in 1410, NIM was forgotten.

The game survived only in a brief description in the diary of one of the queen's ladies in waiting (who invented her job title after waiting for hours while the queen played NIM with the duchess). One hundred eighty-nine years later a descendant of the maiden, Pilfer Babbage, came upon the diary in an old trunk. The game fascinated the penniless boy of 12, and he invented a version using pebbles instead of gold coins. However, since he desperately longed to play the original, and since the game had taught him to take things, he embarked on a successful career as a pickpocket, stealing gold coins from the pockets of the nobility.

Pilfer was a friendly fellow, a natural leader among his cohorts. He introduced them to NIM, and they took to it with delight. Soon they merged the language of their hobby with that of their profession and the long-forgotten verb *nim* came back into fashion with a subtle change in meaning. However, when Pilfer Babbage was finally caught and hanged in 1671 at the ripe old age of 85, his fraternity honored him by changing the name of their vocation to *pilfering*.

Pilfer's great-great grandnephew, Charles, adapted the game to the analytical engine in 1833 as the second computer game (after Star Trek). Charles then went on to distinguish himself in the family tradition by inventing cost overruns in government contracts, and the game of NIM continued down to the present day in a myriad of forms.

# PARACHUTE

*By Norman McAllister*

The hum of the engines have almost lulled you to sleep, despite the excitement of the moment. Suddenly, the alarm bell rings. The jump-master motions for you to get into position. The wind roars past the open door. A tap on the shoulder and out you go. There is the illusion of floating even though you are falling at better than 90 miles per hour. Ripcord! You are snatched back into reality as the chute deploys. You steer toward the target area and land with a roll and twist. Ten feet from the center. Not a bad jump.

```

# PICTURE PUZZLES

*By Arnold Gross*

The computer scrambles the pieces. The object of the game is get them back together again. You can try it the hard way or get a tantalizing look at the whole picture.

The game has five puzzles, on five levels of play, from very easy to extremely difficult. There is something for everyone in the family, from little Joey to mad genius Uncle Sylvester!

# PLAY IT AGAIN, SAM

*By Alan J. Zett*

The computer plays a note, then two and three; soon it's playing a little tune, and you're trying to remember exactly how it goes, by the tones and the letters with them, so you can duplicate it. Did it go H, Y, Y, G, B, or was it H, G, Y, Y? . . .

The string of letters/tones goes on for 8 to 32 notes, depending on the level of difficulty you selected. Since the tones are chosen at random, it's a pleasant surprise when they seem to follow a familiar melody. But once in a while you'll hear a sequence of notes that might inspire you to write a new song—who knows, it could be in the Top 40!

By now, most of you will recognize the sound routine that is poked into line 2000. It will give you a strange listing after you run the program, so it is best to save it on tape or disk before running, or else retype line 2000 before saving the program.

```
0 CLS:PRINT"
NOTE: BECAUSE OF MY SOUND ROUTINE, WHEN YOU LIST THE PROGRAM,
PART OF IT WILL SCROLL FUNNY AND LOOK GARBLED. TO GET A BETTER
IDEA WHAT CAUSES THIS, EDIT 2000 AND STEP THROUGH IT 1 SPACE
AT A TIME.

# SONIC TORPEDOES

*By Phillip Case, Jr.*

SONIC TORPEDOES is a target game in which you have a fixed torpedo launcher. Three different types of alien spacecraft fly over your launcher. Your goal is to destroy as many of the spacecraft as possible, given the number of torpedoes and amount of time allotted. As you destroy more ships, your rating (displayed in the lower right-hand corner of the screen) will increase.

## Special Features

SONIC TORPEDOES is unique in two ways. First, it is one of the few programs with sound effects that work in 4K of RAM. Second, it makes use of Voice Input. You fire your torpedoes by saying the word "Fire" into a microphone that is plugged into the cassette recorder. This function is achieved by use of the INP (255) command.

*Note:* Because the cassette amplifier is used in the voice command, the sound effects require an external amplifier such as one sold by Radio Shack under the Archer name for \$12.00. Also, the program is designed to be compatible with both Level II and disk BASIC.

# SPELLING BEE

*By James Garon*

Does your child hate spelling? Here's a program to transform your TRS-80® into a speaking, spelling fun machine.

The first step in using SPELLING BEE is to teach the S-80 how to spell the words. If possible, use the word list that your child brings home from school. The easiest way to enter the list (up to 20 words) is to type

RUN 1    ENTER

The computer will respond with instructions for entering the words, and a large cursor will appear at the left side of the screen. From this point on, every word you type will be displayed in giant letters (about 4 inches tall). Each word may be up to ten characters long and may contain apostrophes, hyphens, or blanks. Two editing keys are provided in case of error. The backspace key ( $\leftarrow$ ) works in the usual way, erasing one character each time it's pressed. The **CLEAR** key will erase the entire word, allowing you to begin that word again. When the word is spelled correctly, press **ENTER** and the computer will store the word in a special DATA statement at line 1000.

## **Programming Hint**

If you type in the program yourself, be sure to type as many slashes (/) as line 1000 will hold before running the program. This reserves space for the data. Never edit line 1000. Should you wish to type in your own DATA statement, use any vacant line number smaller than 999. If your list contains fewer than 20 words, the final entry must be XXX.

The second step is to give your computer a voice. When the final word has been entered, the computer will direct you through the process of creating an audio tape. The instructions that appear on the screen tell you which wires to pull, which buttons to press, and exactly how far to rewind a blank tape. Don't forget to remove the small plastic plug from the MIC jack. This will allow the built-in condenser microphone to pick up your voice. (Put the plug back after recording so that future CSAVEs will not be spoiled by room noise.) The first time through, you may wish to step through the procedure without actually making a recording. This way you can get used to pacing your voice so that you can comfortably say your "lines" during the time that the "on the air" light is traveling across the screen. When you are through rehearsing, hit **BREAK** and type RUN 2. This command tells the computer to help you with the audio tape from the beginning. Should you make an error while recording, simply hit **BREAK** and type RUN 2 again.

When the final word has been recorded, the computer will instruct you to rewind the tape. You do not need to unplug the remote wire. The computer has disconnected this wire in software. When the tape is re-wound, pressing **ENTER** will effectively plug the remote wire back in.

Now it's time to test the program. This time, just type RUN and answer the question, "DO YOU WANT INSTRUCTIONS?" with the word "NO." Again the computer will tell you which wires to pull, which buttons to press, and how far to rewind your audio tape. (Notice that the tape is wound to one spot for recording and to a different spot for playback.) Pressing **ENTER** at this point begins the main program. The recorder should turn on automatically, speak the first word, and shut itself off. Wait for the giant cursor, and then type in your response. If you spell the word correctly, the computer will say so (on the screen), and the next word will be spoken by the recorder. If you spell the word incorrectly, press **CLEAR** and try again. If the second attempt is wrong, the correct spelling will be displayed (in giant letters). Press **ENTER** to hear the next word.

After your response to the final word, your score will be given, and the audio tape may be rewound (again without pulling the remote wire). Now CSAVE the program on a different tape from the audio, and it will be ready to use until the next word list arrives home from school.

# SUPER PACHINKO

*By James P. MacLennan*

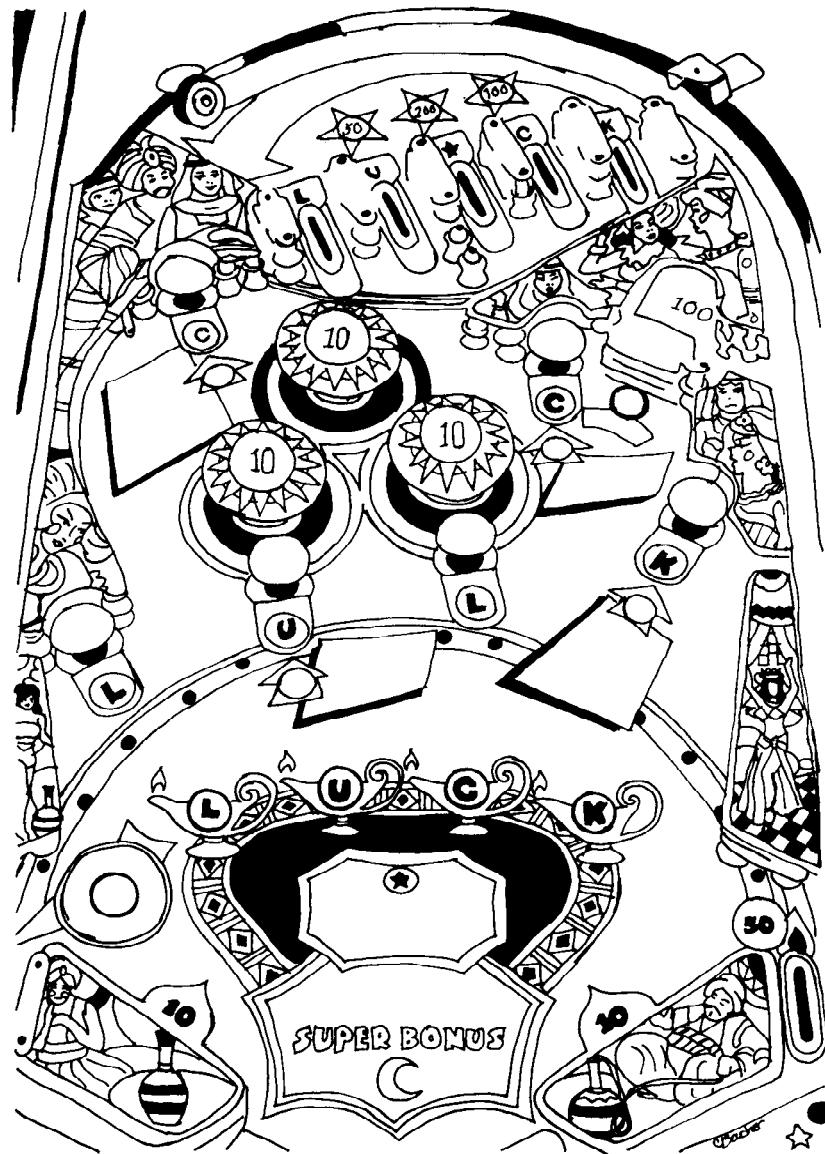

This game is patterned after the famous Pachinko machines imported from the Orient.

In this version, you are given 15 balls to shoot. To pull back the plunger, hold down the key, and to release and send the ball on its way, press the key. The farther you pull the plunger back, the farther the ball will travel across the top before starting down.

The targets will give you 10, 20, or 100 points, depending on which you hit. Three bonus balls are given for hitting one of the bottom targets. Total score is given at the top right of the screen. The number of balls left to shoot is found on the bottom of the screen.

For sound effects, plug the cassette auxiliary jack into an audio amplifier and get the feeling of being in an arcade with your computer as the PACHINKO game.

# TENPIN BOWLING

*By Frank B. Rowlett, Jr.*

Bowling, although its popularity seems to have diminished somewhat in recent years, is still the most popular participant sport in America. As the ad goes, there's just something about the thrill of "setting 'em up and knocking 'em down."

Although many bowling simulations have been written for the TRS-80®, this version, by far, comes closest of any to the real thing—this side of renting shoes! But, please, don't lob the ball!

```

## THE SOFTSIDE SAMPLER: TRS-80™ ENTERTAINMENT PROGRAMS

SoftSide Publications  
Edited by Joan Witham

Save a princess! Parachute from a plane! Compete in a wrestling match!  
... all with your TRS-80!

Here are 29 exciting entertainment programs from *SoftSide* magazine, including both short, simple game programs and longer, more complex adventures. Test your nautical skills with such programs as *Around the Horn* and *Battleship*, or your driving abilities with *Barrier* and *Drag Race*. *Calculated Risk* is guaranteed to bring out the gambler in you! *The SoftSide Sampler* will provide hours of amusement for computer game enthusiasts. These programs feature special graphics and sound effects.

### Other Books of Interest...

#### STIMULATING SIMULATIONS, Second Edition

By C. W. Engel

An exciting handbook containing twelve "simulation programs," which are actually game programs. These original and well documented programs are clearly written in a BASIC format that is compatible with all microcomputers. Each program is presented with a listing, sample run, instructions, a flowchart, and ideas for variations. "This book is a good starting point for the computer hobbyist who wishes to explore the use of the small computer in simulating real events." *Computer Notes*

#5170-0, paper, 108 pages

#### BEAT THE ODDS: Microcomputer Simulations of Casino Games

By Hans Sagan

Provides realistic microcomputer simulations of five popular casino games: Trente-et-Quarante (Thirty and Forty), Roulette, Chemin-de-Fer, Craps, and Blackjack. Each chapter begins with a computer run of the game program, followed by an explanation of the rules and objectives and the execution of the game. Acceptable bets and how to place them are discussed and playing systems and strategies are examined. Finally, the computer program is developed and various modifications of the program are detailed. All programs are in BASIC and are annotated for readability and ease of conversion.

#5181-6, paper, 128 pages

#### PROGRAMS FOR BEGINNERS ON THE TRS-80™

By Fred Blechman

Here's a valuable book of practical and interesting programs for home use designed for the beginner in personal computer programming. You'll learn step-by-step how 21 sample TRS-80 programs work. Program techniques are described line-by-line within the programs, and a unique Matri-Dex™ matrix index will enable you to locate other programs using the same TRS-80 BASIC commands and statements. Each program includes a detailed description, a complete listing, an explanation of what the program does, and instructions for modification.
