

## All About Alphanumeric Display Terminals

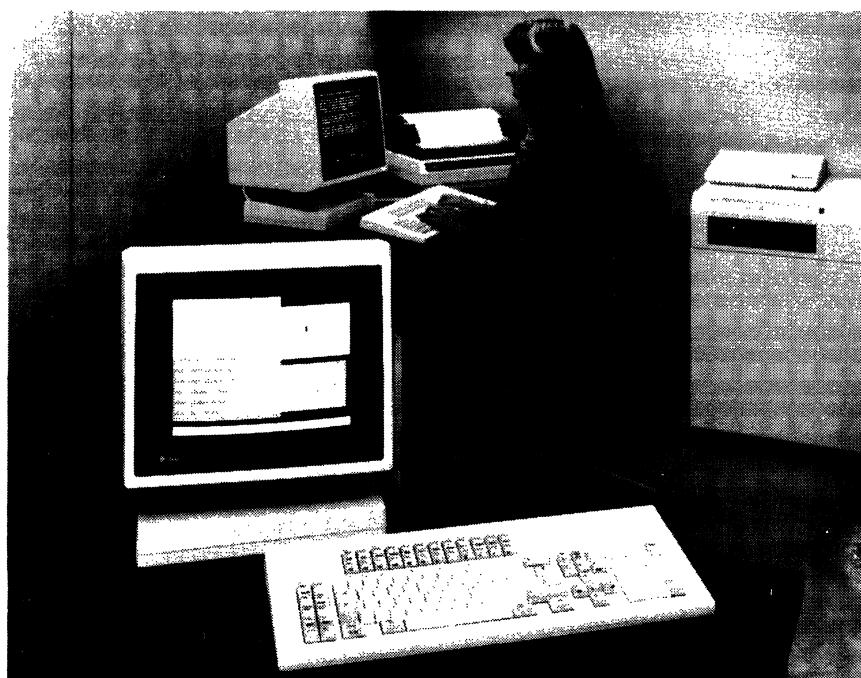

The video display terminal (VDT, or CRT, as it is commonly referred to) is the principal interface between people and computers. As the computer (particularly the micro-computer) becomes pervasive in today's business world, more and more people are being exposed to this popular business tool. Originally invented as a "glass teletype," an alternative to using a teleprinter terminal as a computer operator console, the display terminal has evolved to the point where it is a primary component in the vast majority of modern computer applications, including data entry, inquiry/response, program development, business and scientific graphics, word processing/text editing, CAD/CAM, and many others. For the purpose of this report, we will focus on alphanumeric display terminals designed for general-purpose business applications.

The steady introduction of improvements in CRT design and functional capability, such as editing, highlighting, protected fields, split-screen functions, color screens, and ergonomic housing, has contributed to the growth of the market. However, the single most important factor in today's display terminal market, in terms of how it affects both the vendor and the end user, is the continuing downward trend in pricing. Historically, price has been set in proportion to capability; dumb terminals have carried the lowest price tags, with fully featured smart editing terminals on the high-end of the price scale. While this is still true, advances in technology have caused the lines of distinction between what is dumb and what is smart to be blurred; meanwhile, prices have fallen, drastically in some cases. The classic dumb terminal, as it was known ten years ago, is now virtually extinct.

The traditional alphanumeric display terminal, threatened by the onslaught of microcomputers with terminal emulation capabilities, remains alive and well. In fact, market studies consistently show a steady, stable growth for this market in the next few years. This report focuses on non-user-programmable alphanumeric display terminals designed for general-purpose business applications. It includes a brief historical summary of the market; current market trends; developments in ergonomics; and a look at the industry's major segments. Also included are comparison columns detailing the specifications of 352 display terminal models offered by 87 vendors.

As with all segments of the hardware industry, technological improvements have led to lower prices for the user. Nowhere is this more obvious than in the display terminal market. Consider that about five years ago only the most basic dumb ASCII terminals carried a price tag below \$1,000. Today, the low-end price has fallen to below \$400, with the majority of basic smart terminals available in the \$500-to-\$1,000 range. Prices in the IBM 3270 segment of the market, traditionally much higher than in the asynchronous segment, have also fallen. Where once they sold for over \$2,000, basic 3270-type terminals can now be purchased for around \$1,000; the prices fall even lower when purchased in quantity.

These lower prices have reduced profit margins for vendors and have made competition in the terminal market tougher ▶

*The AT&T 6500 Multifunction Communication System is made up of modular controllers, terminals, personal computers, and printers; up to 32 devices can be connected in a cluster, and can communicate directly with multiple hosts using both synchronous and asynchronous protocols. Standard and multitasking displays are available.*

## All About Alphanumeric Display Terminals

Since Digital's introduction of the VT220 in 1983, a large market for VT220 emulating terminals has sprung up. Ampex Corporation has added the Ampex 220 to its terminal product line. Selling for \$749, the Ampex 220 provides a 14-inch display screen with 80- or 132-column display capability.

► and riskier than ever. This past year saw ITT subsidiary Qume unveil its QVT 101, a smart terminal with a price tag of \$395. Many of Qume's competitors accused the company of attempting to buy market share, saying that Qume could not be making money on such a low-priced terminal. Nevertheless, within a few months, most of Qume's major competitors had also introduced a sub-\$400 unit. The problem at this end seems to be one of distribution; at such low prices, distributors are simply unwilling to carry them, given the low margins that they will bring. Still, the market remains vigorous, and new vendors continue to enter. The real winner in all of this, obviously, is the user, who continues to gain more functionality per terminal dollar.

Today, there are somewhere in the neighborhood of 10 million display terminals installed throughout the United States. However, the healthy growth of this market has been jeopardized by the popular acceptance of the microcomputer by corporations. As microcomputer prices also tumble, many firms are using them as multipurpose workstations that usurp some of the functions traditionally performed by display terminals. As microcomputer-to-mainframe links improve, more and more microcomputers will be able to perform terminal tasks in addition to microcomputing tasks. Datapro has seen a drop in the number of companies entering the terminal market in the past few years, as well as a small shakeout. At the other end of the spectrum, however, lies the multiuser microcomputer, that provides another market into which the display terminal vendor can sell. The days of tremendous growth in the terminal industry would appear to be over; and, in fact, many of the established terminal vendors have experienced financial difficulties in the past year. But the display terminal will remain an important part of the computer industry for the foreseeable future.

### GENERAL CATEGORIES

All of the terminals covered in this report have three features in common: 1) each has a keyboard that can

generate, and a monitor that can display, a full alphanumeric character/code set; 2) each has the capability to send and receive data via communications lines to a remote host computer; and 3) each is marketed for general-purpose use in the United States and Canada, and is identified as a distinct product to end users.

Historically, display terminals have fallen into one of three general categories: dumb, smart, and user-programmable. For the sake of historical reference, here are Datapro's definitions of these three types of terminals.

*Dumb* terminals offer a limited number of functions; most feature teletype compatibility.

*Smart* terminals offer extended functions, such as editing and formatted data entry. In some cases, the user can tailor the terminal to fit his/her own application via a limited degree of programming, such as format creation and parameter definition.

*User-programmable* (or *intelligent*) terminals feature software support. The vendor typically provides an operating system, an assembler- or compiler-driven programming language, subroutines, I/O utilities, one or more protocol emulators, and one or two application programs, such as data entry and text editing.

These categories have been squeezed from both sides, however. At the high end, user-programmable terminals have all but given way to microcomputers; very few companies continue to manufacture these high-priced terminals. At the low end, advances in technology and plunging prices have led to the extinction of the dumb terminal as such. Today, virtually all display terminals on the market fall into the smart terminal category.

### MICROPROCESSOR CONTROL

All display terminals currently manufactured are microprocessor-controlled. Microprocessor-based programs (firmware) reside in ROM or PROM memory. ROM-resident programs, which are inexpensive when reproduced in large quantities, control those features which are permanent and unchangeable; while PROM-resident programs are typically produced in smaller quantities and implement customized or modifiable features. Either type can be replaced by simply removing the old chip and putting in a new one. This flexibility is highly beneficial to the manufacturer, since older equipment can be updated and nonstandard customer specifications can be fulfilled without costly hardware changes. Theoretically, program interchangeability might also benefit the user, but in practice it is doubtful that the requirements of a particular user will change often enough to make it a great advantage. The fact that PROM replacement generally must be done at the factory or by a field service technician precludes frequent PROM replacement.

In addition to controlling basic terminal functions, the microprocessor firmware can provide protocol emulation, define the character/code sets to be generated by the key ►

# All About Alphanumeric Display Terminals

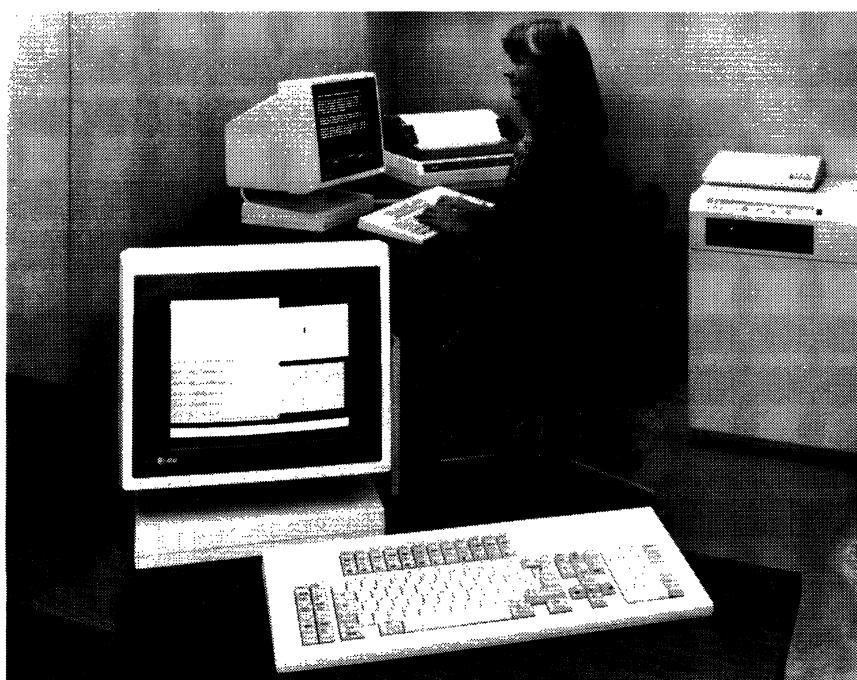

The video display terminal (VDT, or CRT, as it is commonly referred to) is the principal interface between people and computers. As the computer (particularly the micro-computer) becomes pervasive in today's business world, more and more people are being exposed to this popular business tool. The days of tremendous growth in the terminal industry would appear to be over; and, in fact, many of the established terminal vendors have experienced financial difficulties in the past year. But the display terminal will remain an important part of the computer industry for the foreseeable future.

### GENERAL CATEGORIES

All of the terminals covered in this report have three features in common: 1) each has a keyboard that can

generate, and a monitor that can display, a full alphanumeric character/code set; 2) each has the capability to send and receive data via communications lines to a remote host computer; and 3) each is marketed for general-purpose use in the United States and Canada, and is identified as a distinct product to end users.

Historically, display terminals have fallen into one of three general categories: dumb, smart, and user-programmable. For the sake of historical reference, here are Datapro's definitions of these three types of terminals.

**Dumb** terminals offer a limited number of functions; most feature teletype compatibility.

**Smart** terminals offer extended functions, such as editing and formatted data entry. In some cases, the user can tailor the terminal to fit his/her own application via a limited degree of programming, such as format creation and parameter definition.

**User-programmable** (or *intelligent*) terminals feature software support. The vendor typically provides an operating system, an assembler- or compiler-driven programming language, subroutines, I/O utilities, one or more protocol emulators, and one or two application programs, such as data entry and text editing.

These categories have been squeezed from both sides, however. At the high end, user-programmable terminals have all but given way to microcomputers; very few companies continue to manufacture these high-priced terminals. At the low end, advances in technology and plunging prices have led to the extinction of the dumb terminal as such. Today, virtually all display terminals on the market fall into the smart terminal category.

### MICROPROCESSOR CONTROL

All display terminals currently manufactured are microprocessor-controlled. Microprocessor-based programs (firmware) reside in ROM or PROM memory. ROM-resident programs, which are inexpensive when reproduced in large quantities, control those features which are permanent and unchangeable; while PROM-resident programs are typically produced in smaller quantities and implement customized or modifiable features. Either type can be replaced by simply removing the old chip and putting in a new one. This flexibility is highly beneficial to the manufacturer, since older equipment can be updated and nonstandard customer specifications can be fulfilled without costly hardware changes. Theoretically, program interchangeability might also benefit the user, but in practice it is doubtful that the requirements of a particular user will change often enough to make it a great advantage. The fact that PROM replacement generally must be done at the factory or by a field service technician precludes frequent PROM replacement.

In addition to controlling basic terminal functions, the microprocessor firmware can provide protocol emulation, define the character/code sets to be generated by the key-►

## All About Alphanumeric Display Terminals

► board and displayed on the screen, implement special features, set control parameters, etc. Firmware specifications are generally determined at the time of order, and once the firmware is in place, execution is transparent to the user. Some vendors have predetermined programs from which to choose; a few permit users to submit their own firmware specifications.

### DISPLAY MEDIA

The vast majority of display terminals manufactured today use a cathode ray tube (CRT) as the display medium. The popularity of this device stems from its flexibility, high capacity of characters, and relatively low cost.

In addition to being able to display alphabetic and numeric characters in virtually any format, the CRT can highlight characters by means of underscoring, reverse video, blinking, or varying levels of brightness. Some CRT terminals can display double-size characters. Today, more and more CRT terminals have a graphics character set for creating forms and report formats on the screen. Some CRTs also permit the creation of business graphics—for example, bar, column, and pie charts reflecting sales, income and expense, inventory levels, etc. Interactive graphics or engineering graphics, on the other hand, is a completely different discipline which requires a high-resolution graphics terminal. Graphics terminals can also display alphanumeric characters, but they are considerably more expensive. Graphics terminals which are used primarily for scientific or laboratory applications are not included in this report.

Other types of alphanumeric displays have existed for years, and at one time were thought to be a serious challenge to the CRT. Examples of these are LEDs (light-emitting diodes), which are very popular in calculators and point-of-sale (POS) terminals, and gas-discharge displays such as IBM's 3290. In fact, there is quite a bit of research and development going on concerning flat screen, plasma displays; many industry observers expect these new displays to become a factor in this market very shortly. The chief advantages of these alternate types of displays are that they provide extremely sharp images, and are more compact than the traditional CRT. However, as of this time, they remain quite expensive, and have found only a small niche in certain specialty applications.

### ERGONOMICS

According to the American National Standard ANSI 294.1-1972, *ergonomics* is defined as "a multidisciplinary activity dealing with the interactions between workers and their total working environment, plus such traditional and environmental aspects as atmosphere, heat, light, and sound, as well as of tools and equipment of the workplace."

Display terminal manufacturers have become increasingly aware of the need to consider human factors, or ergonomics, in the design of their equipment. The trend toward making CRTs more "operator-friendly" began in Europe, particularly in the Scandinavian countries, where powerful unions representing clerical workers have implemented

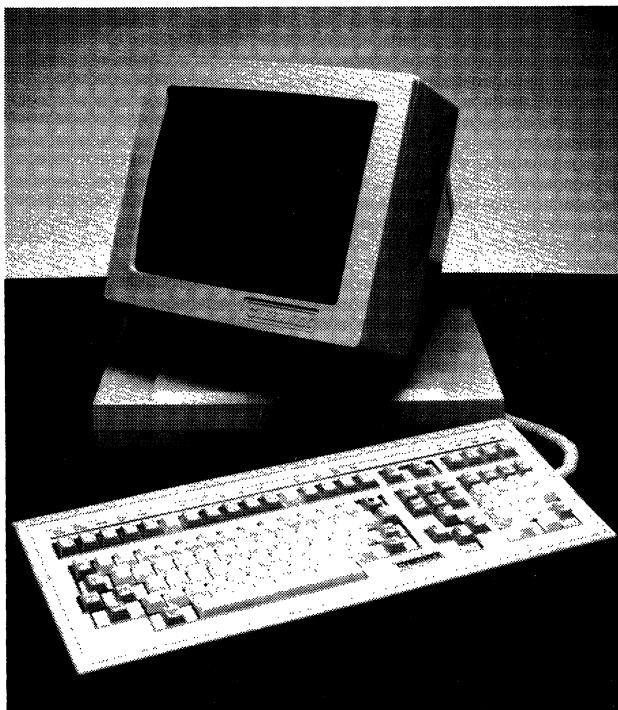

rigid guidelines as to what types of display terminals their members will use.

While no such guidelines are currently in effect in the United States, virtually all CRT manufacturers have recognized market opportunities in ergonomic designs, and are attempting to attract customers through marketing campaigns emphasizing the human factors that influenced the design of their terminals.

The average operator of a display terminal is concerned primarily with two components with which he or she has the most interaction; the keyboard, for input of data, and the display screen, for verifying what was keyed and for reading the output data. Ergonomic design improvements are therefore concentrated on these two components.

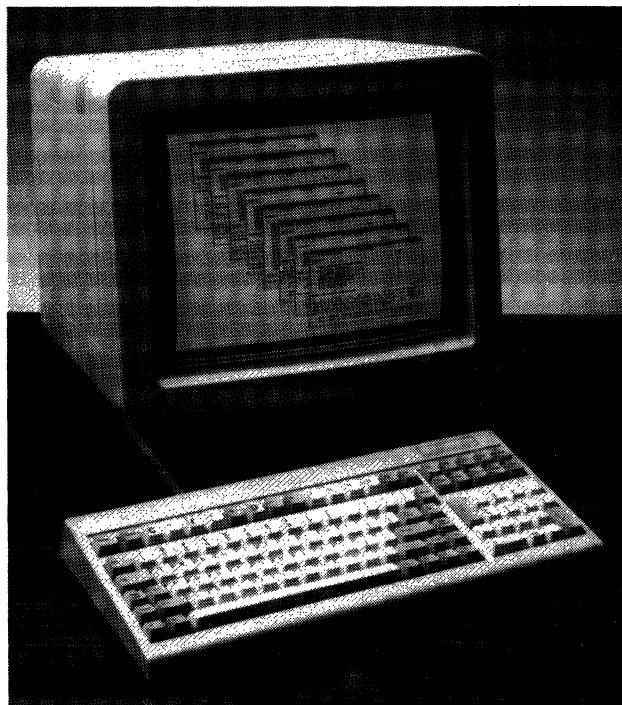

Virtually all display terminal vendors now offer keyboards that are detached or detachable. Connected to the display console via a cable or coiled wire, these keyboards may be placed at some distance (usually 3 to 6 feet) from the console, allowing the operator to place the keyboard in the most comfortable position(s) while working at the terminal.

The layout of the keyboard is also a concern. Most keyboards feature a typewriter-style layout, for ease of training personnel already familiar with a typewriter's key arrangement. Dedicated (separate) numeric keypads are also generally available for applications requiring fast numeric entry; these duplicate the key arrangement of a pocket calculator or adding machine. In addition, some vendors

*Cybernex Limited, of Canada, manufactures a broad line of display terminals offering emulation of several popular terminal models. Vendors whose terminals Cybernex emulates include Burroughs, Data General, Digital Equipment, Hewlett-Packard, Honeywell, and IBM.*

## All About Alphanumeric Display Terminals

*Ann Arbor Terminals recently introduced the VXL display terminal. The VXL provides display screen capacities ranging from 36 lines by 80 columns up to 60 lines by 160 columns. The VXL can connect to multiple hosts, and offers a multiwindow display.*

► have added a palm rest for the numeric pad, for operator comfort. Many vendors also offer sculptured key caps in place of flat key caps, to facilitate speed of data entry and improve operator comfort. For keyboard feedback, vendors may offer either audible or tactile (touch-sensitive) key click, which tells the operator that the key has been depressed far enough to register.

Another important design factor to be considered is the slope and thickness of the keyboard assembly itself. Most keyboards manufactured today are either sloped or stepped, and the optimum profile angle generally is believed to be between 5 and 15 degrees. It has also been determined through studies that the thickness of the keyboard, or the distance from the base of the keyboard to the home row of keys, generally should not exceed 30 mm. The vast majority of keyboards manufactured today have a low-profile design that conforms to the German DIN (Deutsches Institute fur Normen) standard for ergonomics.

Operator eyestrain or fatigue is a consideration which must be dealt with when designing a CRT display screen. Most display screens produced today are etched or contain a bonded faceplate to reduce glare. A few companies are now offering display screens that are flat, instead of curved at the edges. These flat displays provide a more uniform display over the entire screen, particularly around the edges. A method of glare reduction found to be the most popular among manufacturers is the addition of tilt and/or swivel adjustments. These adjustments not only allow the operator to place the viewing area in a position to avoid

glare, but also to place the screen at the most comfortable viewing angle.

The phosphor color and size of characters also contributes to their legibility. Green phosphor has replaced white as the standard for the majority of display terminal models. Amber phosphors are now very popular in Europe, and many domestic vendors now offer amber phosphor characters in this country. However, there is currently no scientific proof that one phosphor color is easier on the eyes than another. Character phosphor remains a matter of personal preference. The vast majority of display terminals on the market today utilize the dot matrix technique to form characters. The more dots that are contained in the character cell, the sharper the character will appear. For years, 5-by-7 characters were the standard of the industry; today, 7-by-7 and 7-by-9 characters are more common, and they provide a clearer character. Some vendors have incorporated higher refresh rates to reduce image instability, or flicker, in the characters, which further improves their legibility.

The size of the characters generated depends on the size of the screen and the display format used. Characters will be larger on 15-inch (diagonally measured) screens than on 12-inch screens; likewise, characters will be larger in an 80 character-per-line format than in a 132 character-per-line format. For applications requiring a 132-column format, a 14- or 15-inch display screen is preferable.

The most recent trend in terminal ergonomics is toward reduced size. Today's display terminals provide a reduced "footprint" size, that takes up less desk space.

Individually, these improvements may be slight, but when considered cumulatively, they represent a marked improvement over the terminals of five years ago.

All of the above features merit serious consideration by potential terminal buyers. Although many ergonomic features may be ordered from the terminal manufacturer, the increased emphasis on ergonomics has led to the springing up of a number of specialty companies that offer devices that can be *added* to terminals to make them more user-friendly. Several companies market optical display filters, glare shields, noise shields, etc., which are designed to fit most major displays. Modular office furniture manufacturers also offer work stations that provide tilt/swivel bases for terminals not equipped with these features.

As user awareness of human factors grows, we see ergonomic considerations in the U.S. becoming not simply a market opportunity, but a mandate. Controversy continues to grow regarding the effects that constant use of a CRT has on the health of the operator. Workers whose jobs require them to sit at the display all day have complained of headaches, dizziness, back pains, and nausea. The National Institute for Occupational Safety and Health (NIOSH) has conducted research studies on this subject (copies of these reports can be obtained from NIOSH). While no definite conclusions have as yet resulted from these studies, it is clear that these concerns are a significant matter that must ►

► be addressed by both vendors and buyers. As of this time, they are being addressed out of concern for market share in a highly competitive market. It is expected, however, that domestic unions will follow the lead of European unions and place standards for VDT use in future contracts. Ergonomic features will then be mandatory.

### MAJOR DISPLAY MARKETS

The alphanumeric display terminal market generally is acknowledged to contain two major segments: the ASCII (asynchronous) terminal market, and the IBM 3270 (synchronous) terminal replacement market. Both segments continue to enjoy healthy growth, particularly the ASCII market. And, as mentioned previously, low prices and increased price/performance have made display terminals more attractive than ever to potential users, and continue to play a major role in the direction of each of these segments.

### IBM's Best-seller, the 3270

The IBM 3270 has strongly impacted the alphanumeric display terminal market since deliveries began late in 1971. The first generation of devices, which were discontinued as IBM products in late 1982, included the 3271/3272 control units, 3275 display station, 3277 display, and 3284/3286/3288 printers. In 1977, the product line was radically overhauled, resulting in the announcement of a second generation of components (the 3274 control unit, 3276 control/display, 3278 display, and 3287/3289 printers) that offered increased capabilities at prices much lower than comparable older models. Along with that announcement came major price reductions on the older equipment. In late 1979, color displays and printers were added to the family.

In March 1983, IBM made some long-awaited changes and enhancements to the 3270 product line. Unveiled were the 3178 Display Station, a smaller and less expensive version of the popular 3278 Model 2 display; new versions of the 3274 Control Unit, offering improved price/performance; the 3290 Information Panel, a gas plasma display; the 3299 Terminal Multiplexer, a coaxial cable eliminator; price reductions of approximately 10 percent on older existing 3270 models; purchase discounts of 40 percent on the 3178 for quantities of 3,000 or more, with the conversion of leased 3278s applying to that quantity; and an option permitting the attachment of the IBM Personal Computer to the 3278 Display Station. These announcements were followed in October with the introduction of the 3270 Personal Computer, a version of the firm's PC for use as part of a 3270 cluster. The 3179 color display and 3180 display, both compact terminals along the same line as the 3178, were unveiled in March 1984.

These changes were made by IBM to protect their large (and lucrative) 3270 installed base. This installed base numbers well over 1½ million units. The independent 3270-compatible terminal vendors, through lower prices or improved price/performance, were seriously eroding IBM's share of the market. These independents include vendors such as ITT Courier, Telex, AT&T, Lee Data, Memorex, and several others. In order to remain competitive, these vendors were forced to reply to the IBM announcements with new products and/or price reductions of their own. Some could not, and a small shakeout occurred, with Raytheon Data Systems (once IBM's number-one competitor in this market) and MDS Trivex exiting the market.

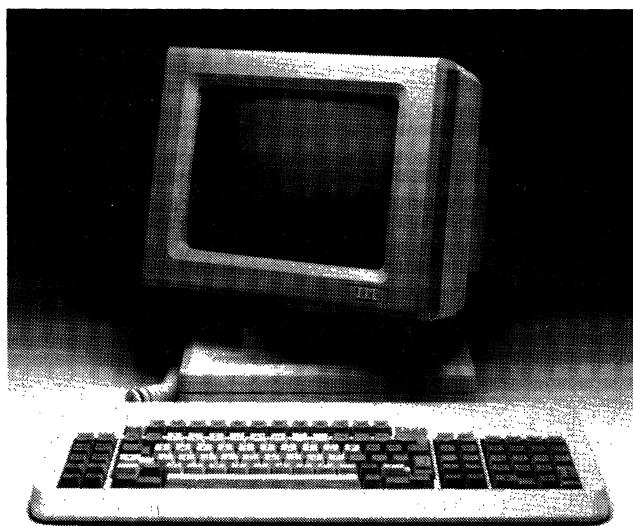

By adding the 3270-PC, as well as Personal Computer attachability, to the 3270 system, IBM has addressed a ▶

## All About Alphanumeric Display Terminals

► threat which is as much internal as it is competitive. The overwhelming acceptance and popularity of the IBM Personal Computer poses a real threat to the entire display terminal industry. As personal computing becomes the rule, and not the exception, in most major corporations, IBM is moving to protect its huge 3270 installed base by incorporating personal computing into the 3270 system. Most of the independents now offer some type of personal computing with their product lines, either via their own equipment or through IBM Personal Computer attachability. In the near future, some type of personal computing capability is likely to become requisite for competing in this market.

With the increased pressure from IBM, it is now more important than ever for the independent vendors to offer a complete line of 3270-compatible products. Today's successful independents must couple a full range of products with lower prices, improved price/performance, and added value, in order to create an opportunity to penetrate an IBM shop. International Data Corporation, a market research firm located in Framingham, Massachusetts, estimated the installed base of IBM 3270 and plug-compatible terminals to be nearly 3 million units at the end of 1984, with IBM holding nearly a 60 percent share. Clearly, even a small percentage of this market can be extremely profitable for an independent vendor.

In addition to the 3270-compatible vendors, some ASCII terminal vendors have invaded the 3270 market through protocol conversion. On a 3270 network, synchronous terminals can be replaced with asynchronous terminals coupled with protocol converters. These devices allow the ASCII terminal to support the functional characteristics of the 3270 terminal. The advantages of this strategy are twofold—ASCII terminals remain less expensive than their 3270 counterparts, and users with both IBM and non-IBM hosts may utilize the same terminals to access each.

*ITT Courier now offers a line of compact terminals that are plug-compatible with the IBM 3270 family of terminals. The ITT 1778, an alternative to the IBM 3178, can attach directly to IBM 3274 and 3276 controller ports.*

What is in store next for the venerable 3270 family? Most industry observers predict that IBM's next step will be the introduction of a new generation of 3274 control units, which will integrate new functions into the unit. Some of these functions may be the attachability of personal computers and/or ASCII terminals, with switch-selectability between the 3270 and ASCII environments.

Table 1 provides a summary of the major 3270-compatible vendors and their products. This table does not include those products that require a protocol converter for 3270 emulation.

### The ASCII Terminal Market

The ASCII display terminal market is the largest segment of the two major display markets, with regard to number of vendors, number of units marketed, and quantity sold. This market originated as the Teletype replacement market, with units intended to replace the highly popular Teletype ASR 33/35 terminals. Although today not many of the ASCII terminals purchased are actually replacing the older Teletype units, the ASCII terminal market is still often referred to as the teletype-compatible market.

Manufacturers of ASCII terminals generally aim their products at educational and commercial users who require large numbers of low-priced terminals for applications such as order entry and time-sharing.

As was mentioned earlier in this report, price is a key factor for success in this market. The continuing price war involving the low-end entries in the ASCII terminal market has made the recent activity in this segment even greater than in the past. Initially, only the truly "dumb" terminals (like the original dumb unit, the Lear Siegler ADM 3) were available for less than \$1,000. Now, features such as block mode transmission and editing capabilities are available at below traditional dumb terminal prices. In addition to price cutting, vendors are attempting to make their offerings more attractive to potential buyers by adding enhanced features such as business graphics, split-screen or windowing capabilities, and a variety of visual attributes. ASCII terminal vendors are also paying a lot of attention to ergonomics, incorporating features such as tilt/swivel screens and low-profile keyboards into their products.

Leaders in the ASCII field generally provide a full range of terminal models ranging from low-end units to editing models. The current leaders include Wyse Technology, TeleVideo Systems, Applied Digital Data Systems (ADDS), Esprit Systems, Lear Siegler, and ITT Qume. An active but somewhat separate subsection of the ASCII terminal market consists of the Digital Equipment Corporation VT100, its successor, the VT220, and those terminals that offer Digital emulation. A large number of vendors are involved in the Digital Equipment Corporation emulation market, including those general-purpose terminal vendors mentioned above; in fact, most major ASCII terminal manufacturers provide at least one Digital emulator in their product line.

## All About Alphanumeric Display Terminals

► As a by-product of Digital emulation, vendors are now providing ANSI X3.64 code compatibility on their terminals. The American National Standards Institute (ANSI) first published the X3.64 standard for two-dimensional data devices in 1977. The goal of the standard was to standardize control codes for all terminals. The Digital VT100 was the first display terminal to conform to the ANSI standard, and the VT220 also conforms. In order to provide true Digital emulation, the makers of Digital emulators also are required to provide ANSI X3.64 code compatibility on their products.

In addition to Digital, most of the major mainframe and minicomputer vendors offer terminal product lines for use with their computer systems. Hewlett-Packard claims a large installed base of display terminals, as do Burroughs, Data General, and Sperry.

### DISPLAY TERMINAL CHARACTERISTICS

The accompanying comparison charts summarize the characteristics of 352 commercially available alphanumeric display terminals from 87 vendors. Nearly all of the information was supplied by the manufacturers during November and December 1985. Their cooperation is acknowledged and greatly appreciated.

Datapro sent repeated requests for information to over 100 companies known or believed to be in the display terminal business. The usable responses summarized in our charts provide a comprehensive picture of the commercial display terminals that are currently available in the United States and Canada. *The absence of any specific company from our charts means that the company either failed to respond to our repeated information requests or was unknown to us.*

The chart entries and their significance are explained in the following paragraphs.

### TERMINAL DESCRIPTION

Display terminals are available in one of two basic terminal configurations: *stand-alone* and *cluster*. Stand-alone units are typically those that contain all components that support the operation of the terminal including display, keyboard, interface, and power supply within a single cabinet. Auxiliary units such as printers, cassette tape drives, etc., are usually external devices. Sometimes a stand-alone unit includes separate cabinets for terminal control and keyboard/display sections, and it may even include one or two separate displays. A cluster configuration typically includes a terminal control unit and a number of individual cable-connected keyboard/display units that can be located several thousand feet from the controller. In some cases, the vendor provides a multiplexer that accommodates a cluster of stand-alone terminals. The size of a cluster arrangement is defined by the *maximum number of displays per controller*.

Terminals that are designed to be hand-held or to be hand-carried are noted in the entry *transportability*.

Some terminals are designed as direct replacements for other terminals. In the alphanumeric display terminal market, replacement terminals fall into two principal categories: those designed to replace an IBM family terminal are indicated as having *IBM compatibility*; and those designed to replace a terminal in the ASCII/Teletype market are indicated as having *teletype compatibility*.

Some vendors provide *other compatibility*, and can replace terminals such as those produced by Burroughs, Digital Equipment, Honeywell, and Sperry. For example, a wide variety of vendors market terminals that are compatible with the Digital VT100 or newer VT220.

Either of two types of compatibility may be offered: transmission compatibility or "plug-to-plug" compatibility. Transmission compatibility requirements include identical protocol, code and unit code structure, timing, asynchronous or synchronous operation, and transmission speed. Some vendors even provide identical cables, which is a cost-effective consideration in a local cluster environment. Most vendors with transmission-compatible units offer additional features and functions that the original vendor's equipment does not have, implemented via minor changes in host software. Units with true plug-to-plug compatibility not only have identical transmission parameters, but also identical features and functions; no alteration to host software is necessary, but no enhancements beyond the original vendor's equipment are available.

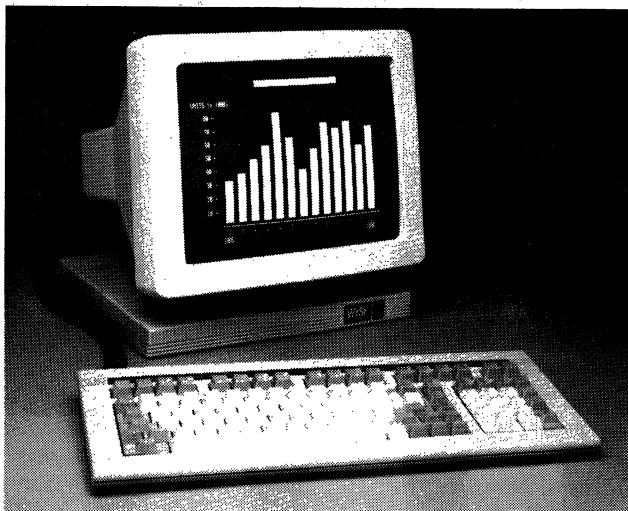

### DISPLAY PARAMETERS

Information displayed on the screen of a CRT is generally arranged according to an orderly format consisting of a maximum number of printed lines per screen and characters per line. The electronic circuitry that produces the display image is designed to a specified set of parameters that define the *display capacity* (i.e., the maximum number of display positions) and the *screen arrangement* (i.e., the maximum number of displayable lines and displayable characters per line). The most common display capacity is 1920 characters arranged in 24 lines of 80 characters. Many vendors offer 132-character display lines, which can eliminate the need to revise or patch software designed for standard 132-column printers or to maintain dual sets of programs for 80-column and 132-column output.

In most terminals, the number of characters that can be stored by the terminal's display memory equals the maximum screen capacity. In some terminals, however, storage is provided for more characters than can be displayed on the screen at one time. This additional data may be stored character-by-character, by the line, or by the "page" (a full screen of data). *Memory capacity* defines the total number of characters, lines, and pages that can be stored in the terminal's display memory.

Information is displayed in a rectangular area, slightly smaller than the total surface of the display screen. The factors that determine the required size of the *screen area* are the display arrangement and the size of the displayable ▶

## All About Alphanumeric Display Terminals

Since its first terminal shipments in 1982, Wyse Technology has risen to the leadership position in the ASCII display terminal market. The company now boasts an installed base of over 250,000 terminals. The WY-50+ is an enhanced version of the WY-50, Wyse's most successful terminal model.

► characters. For example, the typical 1920-character display utilizes a 12- or 15-inch (diagonal) screen area.

Ergonomic factors are becoming increasingly important as terminal features. One such feature gaining in popularity is a *tilt and/or swivel screen*. This feature provides for the mounting of the display monitor onto a separate desktop base or pedestal, and allows the operator to twist the screen vertically ("tilt") and/or horizontally ("swivel") to the most advantageous position for viewing.

The set of *total displayable symbols* and the method of *symbol formation* are functions of the character generator, which accepts coded characters (typically ASCII or EBCDIC) from the computer and keyboard and converts them to a number of dots or strokes so that the form of the symbol or image can be displayed. In CRTs, characters are formed almost exclusively by the dot matrix technique. Each character is formed within a matrix of dots, and only those dots required to form the specific character are intensified. For example, a dot matrix that contains 35 dots is typically arranged 7 dots high by 5 dots wide.

Characters can be made clearer by increasing the number of dots within the matrix. The stroke technique forms characters by drawing short straight lines between specified points. *Character phosphor* refers to the physical coating of phosphorous on the back side of the screen which, when illuminated, creates the displayed characters. The type of phosphor used defines the color of the displayed character, as well as the persistence of the phosphor (a long-persistence phosphor is less likely to cause image flicker problems than a short-persistence phosphor; however, the image of a long-persistence phosphor is more likely to smear when lines are scrolled). Among the more common phosphors available are P4 (white), and P31 or P39 (green). Amber and yellow-green phosphors are also available on some terminals.

Display arrangement, display medium, character phosphor, and symbol formation all have a great impact on display clarity. Several units should be tested to decide which is easiest on the operator's eyes.

Attention can be drawn to vital information and different types of significant data can be visually separated by the use of the following display features:

- *Color*—characters or fields can be separated by color, which also can be used to identify conditions or types of data. IBM's color display, the 3279, is currently emulated by many of the independent 3270-compatible vendors.
- *Graphics*—bar charts, pie charts, and graphs may be used to present certain types of information. In most cases, an affirmative answer in this category indicates the presence of line drawing or special graphics character sets. It generally does *not* indicate the presence of highly sophisticated graphics capabilities found on graphics-dedicated terminals.
- *Underline*—highlights significant information by underlining.
- *Blink*—highlights significant information by causing it to blink off and on.
- *Blank (security)*—sensitive information is transmitted, but not shown on the screen.
- *Bold*—highlights significant information by displaying it at a different brightness level.
- *Reverse*—highlights significant information by displaying a negative image of it, e.g., when normal data is displayed in white on a dark background, the highlighted character or field is displayed in dark on a white background.
- *Double size*—highlights significant information by displaying it in characters which are of larger size than normal. Double height, double width, and/or double height/width characters may be supported.

Some terminals offer several of these display features, which can be combined to produce even more effective results. The features are programmable (usually via the keyboard), and can be used on a character-by-character basis, or in a designated field.

Some applications require viewing more data than can be displayed at one time. The following features satisfy this need:

- *Scroll*—this feature moves all displayed lines of data up or down by one line as a new line is added and an existing one removed. In some cases, the first line is linked with the last so that the data is rolled but not lost. In others, data is lost as it rolls off the screen. This feature permits the user to scan through a volume of data to locate key information.

## All About Alphanumeric Display Terminals

► Many vendors now feature smooth scrolling, in which data is rolled or scrolled smoothly up or down (much the same as the credits at the end of a movie).

- *Paging*—this feature defines and stores two or more discrete frames or pages of data and displays any selected page.

Although scroll and paging features can be software implemented in the host computer, the comparison chart entry applies only to those terminals that implement the feature via hardware or firmware. Many terminals provide the scroll feature, but relatively few provide paging. Some provide both features.

The cursor marks the position on the screen where the next character will be read or written from memory. Cursor controls enable the operator to maneuver the cursor on the screen and facilitate the input and output of data. Different manufacturers use a variety of symbols to indicate the cursor position on the screen, for example, an underline, a reverse video block, or a blinking character. Some terminals allow the operator to choose among several types of cursor symbols; the most typical feature being *selectable blinking cursor*. Some terminals also have *addressable/readable cursors* that enable the position of the cursor to be written or read by the host computer under program control.

Most businesses use printed forms for daily activities such as billing, ordering, payroll, etc. Some CRT terminals can duplicate the printed form on the face of the screen, and data can be keyed into the blank spaces just as the typist enters data into a printed form. This "fill-in-the-blanks" approach to data entry requires a *protected format* capability. Display terminals that incorporate this feature treat the fixed format differently than they treat keyed data. Field identifiers such as "name" or "salesperson number" are protected from inadvertent key entry, and data entry is confined to the variable fields (blank spaces) following the field identifiers.

After having completed entry into the fixed format, the operator transmits the data to the central computer. A feature called *partial screen transmit* promotes line economies by transmitting only the keyed data; the fixed format remains displayed and the "blanks" are erased for the next entry. This feature is also useful for transmitting only a portion of the displayed data such as a field, line, or block.

A few vendors now offer a *split-screen* and/or "windows" feature on their terminals, in which the display screen can be divided or partitioned into a number of separate workspaces. Data in these workspaces can be manipulated (e.g., scrolled, stored, or transmitted) independently of the rest of the screen. *Tabulation* capabilities allow some terminals to automatically move the cursor to the beginning of the next line, or to the beginning of the next variable field within a line of formatted data immediately following the entry of the character that completes the end of the current line or field. The tab key needs to be used only when the current line/field is to remain partially filled.

*Volker-Craig is another company now offering a Digital VT220 emulator. The VC5220 sells for \$795, and offers a 14-inch green or amber display with 80/132-column display capability.*

Editing features in a display terminal can consist of any combination of the functions listed below, although the best terminal for editing purposes would include all of them. Each function is performed with respect to the current position of the cursor. The desirable editing functions are:

- *Character insert*—the capability to insert a character into an existing line of displayed text; the remaining characters shift to the right or "spread" to accommodate the added character. The spreading capability may terminate at the last character position of the line or at the last displayable position on the screen. Data is lost when it is spread beyond the termination point.
- *Character delete*—the capability to delete a character from an existing line of displayed text; the remaining text closes up when the character is deleted.
- *Line insert*—the capability to insert a line of text into existing text; the text spreads to accommodate the added line.
- *Line delete*—the capability to delete a line of text from existing text; the remaining text closes up when the line is deleted.
- *Erase*—the capability to erase a character, line of text, message, field, or the complete screen. Most terminals include character erase and some form of display erase, which may erase the entire contents of the display, just that portion following the cursor location, or a combination of both functions. Line erase is optional in many terminals.

## All About Alphanumeric Display Terminals

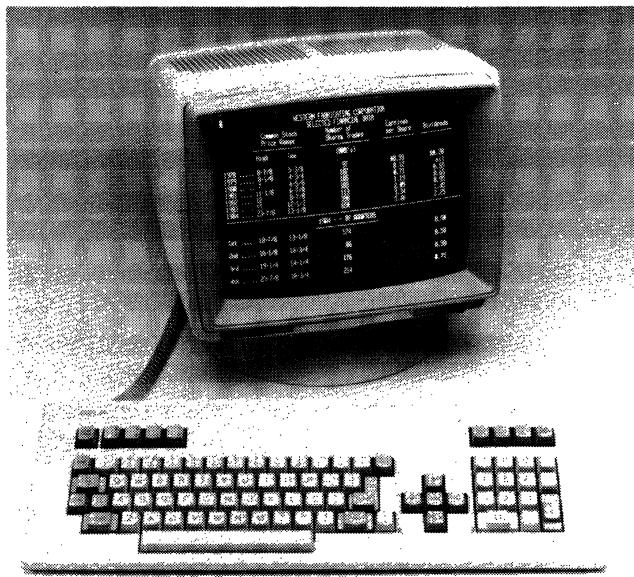

### ► KEYBOARD PARAMETERS

Keyboard *style* defines the general arrangement of keys; e.g., typewriter- or data entry (keypunch)-style. Data entry keyboards have a numeric keypad embedded in the alphabetic part of the keyboard which is accessed via numeric shift. The *character/code set* refers to the set of symbols that appear on the keytops and, in many cases, to the actual character codes generated for each key depression, such as ASCII, EBCDIC, APL, etc. Some terminals are available with more than one keyboard style to satisfy particular user needs.

Keyboards that can either fit flush against the display or be located some distance away via cable connection are referred to as *detachable* keyboards. This feature provides increased configuration flexibility and operator convenience.

Some terminals are available with *program function keys*. These are special keys whose character codes are interpreted by the user's program. A function key is used to reduce the number of required input keystrokes to save time and reduce the number of input errors. Depressing one key could instruct the system to "sell one seat" or "call Chart A," for example.

A *numeric keypad* is a special keyboard feature that includes a set or block of 10 numeric keys, usually located to the right of the main keygroup. These numeric keys are arranged in an adding-machine format and are particularly useful for applications that require a high volume of numeric entries or arithmetic calculations.

Lear Siegler's response to ITT Qume's \$395 QVT-101 is the ADM 3E, selling for \$399. The ADM 3E provides a 14-inch display screen, a low-profile keyboard, a wide range of smart terminal features, and emulation of the Lear Siegler ADM 3A, the original "dumb" terminal.

### ANCILLARY DEVICES

External I/O devices can add considerable flexibility to the applications possibilities for display terminals. Many vendors provide *serial printers* or *line printers* for use with their terminal families. In the case of IBM 3270-type terminals, these devices usually connect to the control unit, not to the display terminal itself.

*Composite video output* allows the terminal to drive an auxiliary monitor. This capability is useful in applications such as computer-aided instruction, where there is a need to display the screen image to a group of people.

*Other devices* supplied and supported by the terminal vendor, such as diskette drives, cassette tape drives, light pens, magnetic stripe (ID card) readers, bar code readers, etc. are also listed. Even if they supply no auxiliary devices themselves, most vendors supply a *port* through which another vendor's printer or other device may be attached to the display.

### TRANSMISSION PARAMETERS

Nearly every display terminal contains a communications interface that enables communications between the terminal and the central computer site. *Mode* and *technique* define the operating mode and the method in which data is transmitted. There are two operating modes: half-duplex (transmission in both directions, but not simultaneously), and full-duplex (simultaneous transmission in both directions).

Data is transmitted synchronously or asynchronously. Asynchronous transmission is characterized by the transmission of data in irregular spurts, where the duration of time can vary between successive transmitted characters; the transmission from an unbuffered teletypewriter is a good example. Synchronous transmission implies the transmission of data in a steady stream. The time interval between successive characters is always precisely the same. The communications interface either provides clocking or accepts external clocking signals from the data set.

*Communications protocol* refers to the type of line discipline (control code sequence and control characters) that the terminal employs. The three most commonly used protocols are ASCII, IBM's Binary Synchronous Communications (BSC) technique, and IBM's Synchronous Data Link Control (SDLC) line discipline. Other large mainframe vendors such as Burroughs, Honeywell, and Digital Equipment Corporation have produced their own communications protocols. Many display terminals now also conform to the ANSI X3.64 standard for control codes; if ANSI standard conformity exists, it will be indicated here.

The transmission *code* refers to the bit pattern of the transmitted characters. Two codes are prominent: EBCDIC and ASCII. The latter has been accepted as an industry and government standard, and is now the most commonly used code by display terminals. EBCDIC is most commonly used with IBM equipment and its replacements.

## All About Alphanumeric Display Terminals

► The CRT terminal is a high-speed device that is usually capable of transmitting and receiving several thousand characters per second; however, it must run at a speed that is compatible with the communications system in which it is used. Most terminals are used on voice-grade facilities, which limit the transmission speed to a practical maximum of 4800 bits per second over the dial network and 9600 bits per second over leased or private lines.

**Message format** refers to the way data is transmitted (e.g., by block, by line, or by character). Terminals that are designed to be transmission-compatible with a teletype unit transmit a character for each key depression. Buffered terminals transmit data in multicharacter blocks. The line or block mode permits data to be composed and edited prior to each transmission and generally permits more efficient utilization of the communications facility. Some terminals offer manual selection between the modes.

**Multipoint operation** characterizes terminals that are capable of operating in a multiple-terminals-per-line environment such as that employed by the IBM 3270 display terminals. Basic to implementing this capability is the ability of a terminal to distinguish a control message intended for it alone. Polling invites the terminals to send data. Addressing informs the terminal that a message from the central computer is coming, so that it will be conditioned to receive. Central control of the message traffic is maintained by the central computer.

Display terminals usually have a *terminal interface* that meets the standards of the EIA RS-232-C specification or the 20 ma current loop, and connects to an external modem or acoustic telephone coupler. Other interface types include RS-422, RS-423, and MIL-188 (military). IBM 3270 and 3270-compatible terminals generally connect directly to a cluster controller via coaxial cable.

Some terminals contain an *integral modem* that can be connected directly to a communications line. In some cases, the vendor provides an *integral acoustic telephone coupler*, so that the terminal can be connected to a conventional telephone handset.

### PRICING AND AVAILABILITY

Terminal pricing is provided for unit quantities (one terminal) unless otherwise specified. *Purchase prices* are shown for the complete terminal (including keyboard, display, and controller) for stand-alone units, and for the keyboard/display station and terminal controller for cluster units. The *monthly and annual prime-shift maintenance charges* show the cost of service during regular business hours (usually 9 a.m. to 5 p.m., Monday through Friday).

Single entries generally indicate the price of the basic unit without options; price ranges show the price of the basic unit and the price of an expanded unit with all options, or the price of the low end and high end of a multiple-unit family. In general, all prices exclude ancillary devices.

*Date of announcement* indicates the date that the terminal was unveiled to the public.

*Date of first production delivery* indicates when the first production model of each terminal was delivered (or is scheduled to be delivered) to a customer.

*Display units installed to date* shows how many display units of each type had been delivered to customers as of approximately December 5, 1985. All figures were supplied by the vendors themselves, and a number of companies chose not to release this information.

*Serviced by* specifies the party responsible for maintaining the terminal. In some cases, the vendor provides total service; in others, a national service organization is responsible. Service is sometimes rendered under the combined efforts of both the vendor and an independent service organization; usually in this situation, the vendor handles those areas close to its headquarters or where it has a multiplicity of installations, and the service company handles other geographical areas.

### COMMENTS

*Comments* at the bottom of the charts describe significant or unusual features, capabilities, or applications which are not reflected in the standard entries.

### VENDORS

Listed below, for your convenience in obtaining additional information, are the full names and addresses of the 87 vendors whose products are summarized in the comparison charts.

Zentec's Zephyr 100 emulates the older Digital VT100; the company also offers a model with VT220 emulation. The Zephyr 100 conforms with the ANSI X3.64 standard for command code compatibility.

## All About Alphanumeric Display Terminals

VENDOR AND MODEL	Link Technologies PCTerm	Matra Scanset 410/415/415HS	McDonnell Douglas Prism 7	McDonnell Douglas Prism 8	Megadata System 850
<b>TERMINAL DESCRIPTION</b>					
Standalone or cluster	Standalone	Standalone	Standalone	Standalone	Standalone
Maximum displays/controller	—	Portable carry case	No	No	No
Transportability	No	No	No	No	Opt.
IBM compatibility	No	Std.	Std.	Std.	Opt.
Teletype compatibility	Std.	Std.	Std.	Std.	Opt.
Other compatibility	Kimtron KT-7, Wyse WY-50	DEC VT100/VT52	—	ANSI mode—subset of DEC VT220	Opt.
<b>DISPLAY PARAMETERS</b>					
Display capacity, no. of char.	1920, 3168	960, 1920	1920	1920, 3168	2000
Memory capacity, no. char./lines/pages	2 pages	2 pages opt.	80/25/1	80 or 132/25/8	16 pages
Screen arrangement, lines x char./line	26x80/132	24x40/80 plus status line	25x80	25x80/132	25x80
Screen area (diagonal), inches	14	9	14	14	15
Tilt/swivel screen	Std.	No	Std.	Std.	Std.
Total displayable symbols	256 ASCII	96 ASCII	96 ASCII	96 ASCII	256
Symbol formation	8x13 in 9x14 field	5x9 in 6x10 cell	7x9 in 9x12 cell	7x9 in 10x12 cell	11x15 dot matrix
Character phosphor	P31 green or P24 amber	P4 white	P31 green std.	P31 green std.; P134 amber opt.	P31 green std.; PC144 amber opt.
Color capability	No	No	No	No	No
Graphics	Line std.	No	No	No	No
Programmable field/char. highlighting via:					
Underline	Std.	Std.	Std.	Std.	Std.
Blink	Std.	No	Std.	Std.	Std.
Blank	Std.	No	Std.	Std.	Std.
Bold	No	No	Std.	Std.	Std.
Reverse	Std.	Std.	Std.	Std.	Std.
Double size	No	No	No	Std.	No
Scroll	Std.	Up/down std.	Up/down, jmp./smth.	Up/down, jmp./smth.	Up/down std.
Paging	2 std.	2 opt.	No	8 std.	Std.
Selectable cursor blinking	Std.	No	Std.	Std.	Std.
Addressable/readable cursor	Std.	Std.	Both std.	Both std.	Both std.
Protected format	Std.	No	Std.	Std.	Std.
Partial screen transmit	Std.	No	No	Std.	Std.
Split screen/windows	Std.	No	Horizontal std.	Horizontal std.	2 std.
Tabulation	Std.	Std.	Fwd./back std.	Fwd./back std.	Fwd./back std.
Character insert/delete	Std.	Std.	Std.	Std.	Std.
Line insert/delete	Std.	Std.	No	No	Std.
Erase	Std.	Std.	Char./line/screen std.	Char./line/screen std.	Char./line/screen std.
<b>KEYBOARD PARAMETERS</b>					
Style	Typewriter	Typewriter	Typewriter, WP, data entry	Typewriter, WP, data entry	Typewriter
Character/code set	ASCII	96 ASCII	96 ASCII	96 ASCII	128 ASCII
Detachability	Std.	No	Std.	Std.	Std.
Program function keys	40 std.	12 std.	18 std.	18 std.	96 std.
Numeric keypad	Std.	No	Std.	Std.	Std.
<b>ANCILLARY DEVICES</b>					
Serial printer, type, and speed	No	120 cps dot matrix	Various matrix	Various matrix	30-350 cps impact
Line printer, type, and speed	No	No	150/300/600 lpm	150/300/600 lpm	No
Composite video	No	No	No	No	Opt.
Port for cust.-supplied devices	Std.	RS-232-C std.	Std.	Std.	3 std.
Other vendor-supplied devices	—	—	—	—	Tape punch, audible alarm, dual diskette drive
<b>TRANSMISSION PARAMETERS</b>					
Mode	Half/full-duplex	Half/full-duplex	Half/full-duplex	Half/full-duplex	Half/full-duplex
Technique	Asynchronous	Asynchronous	Asynchronous	Asynchronous	Async./Sync.
Communications protocol	ASCII	ASCII	RG551A-video cont.	Various	To spec.
Code	ASCII	ASCII	ASCII	ASCII	ASCII/EBCDIC
Speed, bits/second	50-38,400	75-2400	50-19,200	50-38,400	50-19,200
Format	Char./line/block	Line	Character	Character	Char./block
Multipoint operation	No	No	No	No	Std.
Terminal interface	RS-232-C or 20mA	RS-232-C & RJ-11C	RS-232-C	RS-232-C or RS-422	RS-232-C
Integral modem	No	Std.	No	No	Opt.
Integral acoustic coupler	No	No	No	No	No
<b>PRICING AND AVAILABILITY</b>					
Display station, purchase	649	545; 695; 995	Contact vendor	Contact vendor	1,700-2,800
Controller, purchase	—	—	—	—	—
Monthly prime-shift maintenance	—	—	—	—	20-50
Annual prime-shift maintenance	—	—	—	—	—
Date of announcement	11/85	2/82	1/86	1/86	—
Date of first production delivery	11/85	7/82	2/86	2/86	10/81
Display units installed to date	—	—	—	—	—
Serviced by	Dow Jones	Matra, authorized distributors	McDonnell Douglas	McDonnell Douglas	Megadata, third party
<b>COMMENTS</b>	Multi-user PC terminal	Database access terminals; features include: one button auto logon; phone directory; built-in 1200 bps modem; VT100 terminal emulation; local memory; printer port	Replaces the Prism IV; formerly Microdata	Compatible with protocols offered by Tymnet; formerly Microdata	8 bit microprocessor based terminal fea- tures noiseless operation and low power requirements; 2K EAROM for user- selection of trans- mission rate, parity mode, stop bits, etc.
