

HOW TO USE YOUR SOFTWARE CATALOG

This catalog should be used to determine the current status of software on floppy disc, or hard disc. Here's a simple procedure on how to use it. If you are holding a floppy disc in your hand and want to compare it to this list, look at the top line of the label on the disc. There will be a ten digit part number and a revision code number. If the disc is the latest revision, these numbers will correspond to the same columns on the catalog. If you are sitting in front of a HP 64100A or HP 64110A mainframe and want to know if the software resident on the hard disc connected to that mainframe is current, use one of the following procedures:

- (1) Press the "directory" softkey. If the "all-files" softkey appears, press it, type ":HP" , and press the RETURN key. As the file names roll by, look for the file name listed under "TYPICAL DIRECTORY FILE" on the catalog. As it appears, you may temporarily stop the display by hitting the reset key once. If the software is current, the last Modify date displayed will be identical to that listed in the software catalog.
- (2) Press the "directory" softkey. If the "anystring" softkey appears, press it, type in the desired file name (observe all upper and lower case letters), then type ":HP", and press the RETURN key. The file, if present, will be displayed with its Last Modify date. If the software is current, this date will be identical to that listed in the software catalog.
